# Chapter 1

## Grid geometry

### 1.1 Horizontal grid

The horizontal ICON grid consists of a set of spherical triangles that seamlessly span the entire sphere. The grid is constructed from an icosahedron (see Figure 1.1a) which is projected onto a sphere. The spherical icosahedron (Figure 1.1b) consists of 20 equilateral spherical triangles. The edges of each triangle are bisected into equal halves or more generally into  $n$  equal sections. Connecting the new edge points by great circle arcs yields 4 or more generally  $n^2$  spherical triangles within the original triangle (Figure 1.2a, 1.2b).

**Figure 1.1:** Icosahedron before (a) and after (b) projection onto a sphere

**Figure 1.2:** (a) Bisection of the original triangle edges (b) More general division into  $n$  equal sections

ICON grids are constructed by an initial root division into  $n$  sections (**Rn**) followed by  $k$  bisection steps (**Bk**), resulting in a **RnBk** grid. Figures 1.3a and 1.3b show **R2B00** and **R2B02** ICON grids. Such grids avoid polar singularities of latitude-longitude grids (Figure 1.3c) and allow a high uniformity in resolution over the whole sphere.

**Figure 1.3:** (a) **R2B00** grid. (b) **R2B02** grid. (c) traditional regular latitude-longitude grid with polar singularities

Throughout this document, the grid is referred to as the “**RnBk** grid” or “**RnBk** resolution”. For a given resolution **RnBk**, the total number of cells, edges, and vertices can be computed from

$$\begin{aligned} n_c &= 20 n^2 4^k \\ n_e &= 30 n^2 4^k \\ n_v &= 10 n^2 4^k + 2 \end{aligned}$$

The average cell area  $\overline{\Delta A}$  can be computed from

$$\overline{\Delta A} = \frac{4\pi r_e^2}{n_c},$$

with the earth radius  $r_e$ , and  $n_c$  the total number of cells. Based on  $\overline{\Delta A}$  one can derive an estimate of the average grid resolution  $\overline{\Delta x}$ :

$$\overline{\Delta x} = \sqrt{\overline{\Delta A}} = \sqrt{\frac{\pi}{5}} \frac{r_e}{n 2^k}$$

Visually speaking,  $\overline{\Delta x}$  is the edge length of a square which has the same area as our triangular cell.

In Table 1.1, some characteristics of frequently used ICON grids are given. The table contains information about the total number of triangles ( $n_c$ ), the average resolution  $\overline{\Delta x}$ , and the maximum/minimum cell area. The latter may be interpreted as the area for which the prognosed meteorological quantities (like temperature, pressure, ...) are representative. Some additional information about ICON’s horizontal grid can be found in [Wan et al. \(2013\)](#).

**Table 1.1:** Characteristics of frequently used ICON grids.  $\Delta A_{max}$  and  $\Delta A_{min}$  refer to the maximum and minimum area of the grid cells, respectively.

Grid	number of cells ( $n_c$ )	avg. resolution [km]	$\Delta A_{max}$ [km <sup>2</sup> ]	$\Delta A_{min}$ [km <sup>2</sup> ]
R2B04	20480	157.8	25974.2	18777.3
R2B05	81920	78.9	6480.8	4507.5
R2B06	327680	39.5	1618.4	1089.6
R2B07	1310720	19.7	404.4	265.1
R3B07	2949120	13.2	179.7	116.3

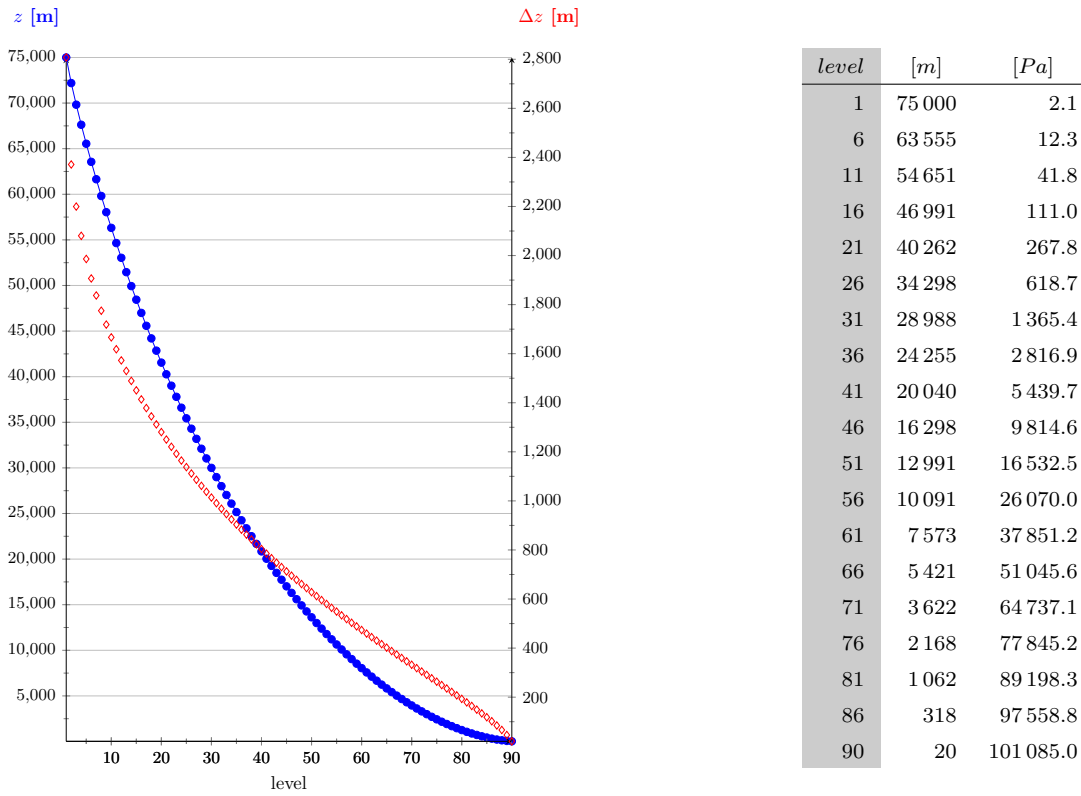

**The first operational version of ICON will most likely be based on the R3B07 grid, thus, having a horizontal resolution of about 13 km!**

### 1.1.1 Local grid refinement

## 1.2 Vertical grid

The vertical grid consists of a set of vertical layers with height-based vertical coordinates. Each of these layers carries the horizontal  $2D$  grid structure, thus forming the  $3D$  structure of the grid. The ICON grid employs a Lorenz-type staggering with the vertical velocity defined at the boundaries of layers (half levels) and the other prognostic variables in the center of the layer (full levels).

To improve simulations of flow past complex topography, the ICON model employs a smooth level vertical (SLEVE) coordinate [Leuenberger et al. \(2010\)](#). The required smooth large-scale contribution of the model topography is generated by digital filtering with a  $\nabla^2$ -diffusion operator. Figure 1.4 shows the (half) levels of the planned operational ICON setup with 90 vertical levels.

**Figure 1.4:** Vertical levels of the ICON model (planned operational setup). The table of selected pressure values (for zero height) is based on the 1976 US standard atmosphere.

## Chapter 2

# Analysis fields

The 3-hourly first guess output of ICON contains the following fields:

Table 2.1: Available 3h first guess output fields

Type	GRIB shortName
Atmosphere	VN, U, V, W, DEN, THETA_V, T, QV, QC, QI, QR, QS, TKE, P
Surface (general)	T_G, T_SO(0), QV_S, T_2M, TD_2M, U_10M, V_10M, PS, Z0
Land specific	W_SNOW, T_SNOW, RHO_SNOW, H_SNOW, FRESHSNW, W_I, T_SO(1:nlev_soil), W_SO, W_SO_ICE
Lake/sea ice specific	T_MNW_LK, T_WML_LK, H_ML_LK, T_BOT_LK, C_T_LK, T_B1_LK, H_B1_LK, T_ICE, H_ICE, FR_ICE
Time invariant	FR_LAND, HHL, CLON, CLAT, ELON, ELAT, VLON, VLAT

Atmospheric analysis fields are computed every 3 hours (00, 03, 06, . . . 21 UTC) with the 3DVar data assimilation system. Sea surface temperature (T\_SO(0)) and sea ice cover (FR\_ICE) are provided once per day (00 UTC) by the SST-Analysis. A snow analysis is conducted every 3 hours. In addition a soil moisture analysis (SMA) is conducted once per day (00 UTC). It basically modifies the soil moisture content (W\_SO), in order to improve the 2m temperature forecast.

For the 3-hourly analysis cycle, ICON must be provided with 2 input files, containing First Guess (FG) and analysis (AN) fields, respectively. Variables for which no analysis is available are always read from the first guess file (e.g. TKE). Other variables may be either read from the first guess or the analysis file, depending on the starting time. E.g. for T\_SO(0) the first guess is read at 03, 06, 09, 12, 15, 18, 21 UTC, however, the analysis is read at 00 UTC. In Table 2.2 the available and employed first guess and analysis fields are listed as a function of starting time.

Table 2.2: The leftmost column shows variables that are mandatory for the assimilation cycle and forecast runs. Column 2 indicates, whether or not an analysis is performed for these variables. Columns 3 to 10 show the origin of these variables (analysis or first guess), depending on the starting time.

ShortName	Analysis	00	03	06	09	12	15	18	21

## Chapter 3

# Mandatory input fields

### 3.1 External parameter

The following external parameter fields are mandatory for the assimilation cycle and forecast runs:

Table 3.1: Mandatory external parameter fields (in alphabetical order)

ShortName	Description	Data source
AER_SS	Sea salt aerosol climatology (monthly fields)	GACP
AER_DUST12	Total soil dust aerosol climatology (monthly fields)	GACP
AER_ORG12	Organic aerosol climatology (monthly fields)	GACP
AER_SO412	Total sulfate aerosol climatology (monthly fields)	GACP
AER_BC	Black carbon aerosol climatology (monthly fields)	GACP
ALB_DIF12	Shortwave ( $0.3 - 5.0 \mu\text{m}$ ) albedo for diffuse radiation (monthly fields)	MODIS
ALB_UV12	UV-visible ( $0.3 - 0.7 \mu\text{m}$ ) albedo for diffuse radiation (monthly fields)	MODIS
ALB_NI12	UV-visible ( $0.7 - 5.0 \mu\text{m}$ ) albedo for diffuse radiation (monthly fields)	MODIS
DEPTH_LAKE	Lake depth	
EMIS_RAD	Surface longwave (thermal) emissivity	GlobCover2009
FOR_D (*)	Fraction of deciduous forest	
FOR_E (*)	Fraction of evergreen forest	
FR_LAKE	Lake fraction (fresh water)	GlobCover2009
FR_LAND	Land fraction (excluding lake fraction but including glacier fraction)	GlobCover2009
FR_LUC	Landuse class fraction	
HSURF	Orography height at cell centres	GLOBE
HSURF_V	Orography height at cell vertices	GLOBE

*Continued on next page*

Table 3.1: *continued*

LAI_MX	Leaf area index in the vegetation phase	GlobCover2009
NDVI_MAX	Normalized differential vegetation index	SEAWIFS
NDVI_MRAT	proportion of monthly mean NDVI to yearly maximum (monthly fields)	SEAWIFS
PLCOV_MX	Plant covering degree in the vegetation phase	GlobCover2009
ROOTDP	Root depth	GlobCover2009
RSMIN	Minimum stomatal resistance	GlobCover2009
SOILTYP	Soil type	DSMW
SSO_STDH	Standard deviation of sub-grid scale orographic height	GLOBE
SSO_THETA	Principal axis-angle of sub-grid scale orography	GLOBE
SSO_GAMMA	Horizontal anisotropy of sub-grid scale orography	GLOBE
SSO_SIGMA	Average slope of sub-grid scale orography	GLOBE
T_2M_CL	Climatological 2m temperature (serves as lower boundary condition for soil model)	CRU climatology
Z0 (*)	Surface roughness length (over land)	GlobCover2009

Note that fields marked with (\*) are not required when using the operational setup. I.e. *FOR\_D* and *FOR\_E* are only required *without* tile approach. Similarly, the surface roughness *Z0* is only needed, if the additional contribution from sub-grid scale orography should be taken into account (i.e. for *itype\_z0=1*). Otherwise, land-use specific roughness lengths are used, which are based on a GlobCover-based lookup table. However, due to technical reasons, all 3 fields must be provided as input, irrespective of the options chosen.

### Remarks for post-processing

Some of the external parameter fields provided by ExtPar are modified by ICON. The following fields are affected: *HSURF*, *HSURF\_V*, *FR\_LAND*, *FR\_LAKE*. Thus, for consistency reasons, those modified fields should be used for post-processing tasks rather than the original external parameter fields.

## Chapter 4

# Available output fields in GRIB2-format

In GRIB2, a variable is uniquely defined by the following set of metadata:

- *Discipline* (see GRIB2 code table 4.2)
- *ParameterCategory* (see GRIB2 code table 4.2)
- *ParameterNumber* (see GRIB2 code table 4.2)
- *typeOfFirstFixedSurface* and *typeOfSecondFixedSurface* (see GRIB2 code table 4.5)
- *stepType* (instant, accum, avg, max, min, diff, rms, sd, cov, ...)

A documentation of the official WMO GRIB2 code tables can be found here: [http://www.wmo.int/pages/prog/www/WMOCodes/WM0306\\_vI2/LatestVERSION/WM0306\\_vI2\\_GRIB2\\_CodeFlag\\_en.pdf](http://www.wmo.int/pages/prog/www/WMOCodes/WM0306_vI2/LatestVERSION/WM0306_vI2_GRIB2_CodeFlag_en.pdf)

In the following, *typeOfFirstFixedSurface* and *typeOfSecondFixedSurface* will be abbreviated by *Lev-Typ 1/2*.

### 4.1 Deprecated output fields

With the launch of ICON, the following former GME output fields will no longer be available:

- **OMEGA** [Pa/s]: Vertical velocity in pressure coordinates  $\omega = \frac{dp}{dt}$ . Since ICON is a nonhydrostatic model, the vertical velocity **W** [m/s] is provided, instead (see Section 4.2).
- **BAS\_CON** [-]: Level index of convective cloud base. Instead, **HBAS\_CON** [m] should be used.
- **TOP\_CON** [-]: Level index of convective cloud top. Instead, **HTOP\_CON** [m] should be used.
- **T\_S** [K]: Temperature at the soil-atmosphere-, or soil-snow-interface. Note that  $T_S = T_{SO}(0)$ , thus **T\_S** is redundant.
- **W\_G1**, **W\_G2** [mm H2O]: Soil water content in upper layer (0 to 10 cm) and middle layer (10 to 100 cm), respectively. If needed, these fields can be derived from **W\_SO**.
- **FIS** [m<sup>2</sup> s<sup>-1</sup>]: Surface Geopotential. Instead, **HSURF** [m] should be used (see Section 4.2).
- **O3** [kg/kg], **TO3** [Dobson]: Ozone mixing ratio and corresponding total ozone concentration. No longer available; no substitution

## 4.2 New output fields

Table 4.1 contains a list of new output fields that will become available with the launch of ICON (compared to GME). A more thorough description of these fields is provided in Section 4.3.

**Table 4.1:** *Newly available output fields*

ShortName	Unit	Description
<b>W</b>	m/s	vertical velocity in height coordinates $w = \frac{dz}{dt}$ (3D field)
<b>DEN</b>	kg/m <sup>3</sup>	density of moist air (3D field)
<b>TKE</b>	m <sup>2</sup> /s <sup>2</sup>	Turbulent kinetic energy (3D field)
<b>HSURF</b>	m	Geometric Height of the earths surface above sea level (2D field)
<b>HHL</b>	m	Geometric Height of model half levels above sea level (3D field)
<b>CLON,CLAT</b>	deg	Geographical longitude/latitude of native grid triangle cell center
<b>ELON,ELAT</b>	deg	Geographical longitude/latitude of native grid triangle edge mid-point
<b>VLON,VLAT</b>	deg	Geographical longitude/latitude of native grid triangle vertex

## 4.3 Available output fields

ICON output is available on two distinct horizontal grids: The native triangular grid with an average resolution of 13 km, and a regular latitude-longitude grid with a resolution of  $\Delta\lambda = \Delta\Phi = 3/16^\circ$ . On the native grid most output fields are defined on triangle cell centers, except for *VN*, which is defined on cell edges. On the lat-lon grid, all fields are defined on cell centers. A single 2D GRIB2 field on the native and regular lat-lon grid contains 2949120 and 1843200 grid points, respectively.

For details regarding the available fields, please see the tables below. Note that the vertical rule in the leftmost column always indicates, whether the field is only available on the native grid (■), on the lat-lon grid (■), or on both grids (■).

### 4.3.1 Time-constant (external parameter) fields

**Table 4.2:** *Time-constant fields (Date D=000000)*

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
HSURF	Geometric height of the earths surface above msl	0	3	6	1/101	inst	m
HHL	Geometric height of model half levels above msl	0	3	6	150/101	inst	m
RLAT	Geographical latitude	0	191	1	1/–	inst	Deg. N
RLON	Geographical longitude	0	191	2	1/–	inst	Deg. E
CLAT	Geographical latitude of native grid triangle cell center	0	191	1	1/–	inst	Deg. N
CLON	Geographical longitude of native grid triangle cell center	0	191	2	1/–	inst	Deg. E
ELAT	Geographical latitude of native grid triangle edge midpoint	0	191	1	1/–	inst	Deg. N
ELON	Geographical longitude of native grid triangle edge midpoint	0	191	2	1/–	inst	Deg. E
VLAT	Geographical latitude of native grid triangle vertex	0	191	1	1/–	inst	Deg. N
VLON	Geographical longitude of native grid triangle vertex	0	191	2	1/–	inst	Deg. E
FR.LAND	Land fraction (possible range [0, 1])	2	0	0	1/–	inst	1
ROOTDP	Root depth of vegetation	2	0	32	1/–	inst	m
EMIS_RAD	Longwave surface emissivity	2	3	199	1/–	inst	1
RSMIN	Minimum stomatal resistance	2	0	16	1/–	inst	s m <sup>-1</sup>
SSO.STDH	Standard deviation of sub-grid scale orography	0	3	20	1/–	inst	m
SSO.GAMMA	Anisotropy of sub-gridscale orography	0	3	24	1/–	inst	1
SSO.THETA	Angle of sub-gridscale orography	0	3	21	1/–	inst	rad
SSO.SIGMA	Slope of sub-gridscale orography	0	3	22	1/–	inst	1
PLCOV_MX	Plant covering degree in the vegetation phase	2	0	4	1/–	max	1
T_2M.CL	Climatological 2m temperature (used as lower bc. for soil model)	0	0	0	103/–	inst	K
NDVLMRAT	ratio of monthly mean NDVI (normalized differential vegetation index) to annual max	0	0	192	1/–	avg	1

### 4.3.2 Multi-level fields on native hybrid vertical levels

**Table 4.3:** Hybrid multi-level forecast ( $VV > 0$ ) and initialised analysis ( $VV = 0$ ) products

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
U	Zonal wind	0	2	2	150/150	inst	$\text{m s}^{-1}$
V	Meridional wind	0	2	3	150/150	inst	$\text{m s}^{-1}$
W	Vertical wind	0	2	9	150/–	inst	$\text{m s}^{-1}$
T	Temperature	0	0	0	150/150	inst	K
DEN	Density of moist air	0	3	10	150/150	inst	$\text{kg m}^{-3}$
QV	Specific humidity	0	1	0	150/150	inst	$\text{kg kg}^{-1}$
QC	Cloud mixing ratio <sup>2</sup>	0	1	22	150/150	inst	$\text{kg kg}^{-1}$
QI	Cloud ice mixing ratio <sup>2</sup>	0	1	82	150/150	inst	$\text{kg kg}^{-1}$
QR	Rain mixing ratio <sup>2</sup>	0	1	24	150/150	inst	$\text{kg kg}^{-1}$
QS	Snow mixing ratio <sup>2</sup>	0	1	25	150/150	inst	$\text{kg kg}^{-1}$
CLC	Cloud cover	0	6	22	150/150	inst	%
TKE	Turbulent kinetic energy	0	19	11	150/–	inst	$\text{m}^2 \text{s}^{-2}$

### 4.3.3 Multi-level fields interpolated to pressure levels

The following pressure levels are available: 1000, 950, 925, 900, 850, 700, 600, 500, 400, 300, 250, 200, 150, 100, 70, 50, 30, 20, 10, 5, 2, 1 hPa. Newly available pressure levels (as compared to GME) are highlighted in red. Note that now all 17 WMO standard pressure levels are included.

<sup>2</sup>for the time being, erroneously encoded as mixing ratios instead of specific quantities

**Table 4.4:** Multi-level forecast ( $VV > 0$ ) and initialised analysis ( $VV = 0$ ) products interpolated to pressure levels

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
FI	Geopotential	0	3	4	100/–	inst	$\text{m}^2 \text{s}^{-2}$
U	Zonal wind	0	2	2	100/–	inst	$\text{m s}^{-1}$
V	Meridional wind	0	2	3	100/–	inst	$\text{m s}^{-1}$
W	Vertical wind	0	2	9	100/–	inst	$\text{m s}^{-1}$
T	Temperature	0	0	0	100/–	inst	K
RELHUM	Relative humidity (with respect to water)	0	1	1	100/–	inst	%

#### 4.3.4 Single-level fields

Table 4.5: Single-level forecast ( $VV > 0$ ) and initialised analysis ( $VV = 0$ ) products

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
PS	Surface pressure (not reduced)	0	3	1	1/–	inst	Pa
T.SNOW	Temperature of the snow surface	0	0	18	1/–	inst	K
T.G	Ground temperature (temperature at sfc-atm interface)	0	0	0	1/–	inst	K
QV.S	Surface specific humidity	0	1	0	1/–	inst	$\text{kg kg}^{-1}$
W.SNOW	Snow depth water equivalent	0	1	60	1/–	inst	$\text{kg m}^{-2}$
W.I	Plant canopy surface water	2	0	13	1/–	inst	$\text{kg m}^{-2}$
TCM	Turbulent transfer coefficient for momentum (surface)	0	2	29	1/–	inst	1
TCH	Turbulent transfer coefficient for heat and moisture (surface)	0	0	19	1/–	inst	1
ASOB.S	Net short-wave radiation flux at surface (average since model start)	0	4	9	1/–	avg	$\text{W m}^{-2}$
ATHB.S	Net long-wave radiation flux at surface (average since model start)	0	5	5	1/–	avg	$\text{W m}^{-2}$

*Continued on next page*

Table 4.5: *continued*

ASOB.T	Net short-wave radiation flux at TOA (average since model start)	0	4	9	8/–	avg	$\text{W m}^{-2}$
ATHB.T	Net long-wave radiation flux at TOA (average since model start)	0	5	5	8/–	avg	$\text{W m}^{-2}$
ASWDIR.S	Surface down solar direct radiation (average since model start) <sup>2</sup>	0	4	198	1/–	avg	$\text{W m}^{-2}$
ASWDIFD.S	Surface down solar diffuse radiation (average since model start) <sup>2</sup>	0	4	199	1/–	avg	$\text{W m}^{-2}$
ASWDIFU.S	Surface up solar diffuse radiation (average since model start) <sup>2</sup>	0	4	8	1/–	avg	$\text{W m}^{-2}$

Table 4.5: *continued*

 RHO.SNOW	Snow density	0	1	61	1/–	inst	kg m <sup>−3</sup>
 H.SNOW	Snow depth	0	1	11	1/–	inst	m
 PLCOV	Plant cover	2	0	4	1/–	inst	%
 LAI	Leaf area index	2	0	28	1/–	inst	1
 NDVIRATIO	ratio of current NDVI (normalized differential vegetation index) to annual max	2	0	192	1/–	inst	1

Table 4.6: Multi-level forecast ( $VV > 0$ ) and initialised analysis ( $VV = 0$ ) products of the soil model

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
 T_SO	Soil temperature	2	3	18	106/–	inst	K
 W_SO	Soil moisture integrated over individual soil layers (ice + liquid)	2	3	20	106/106	inst	kg m <sup>−2</sup>
 W_SO_ICE	Soil ice content integrated over individual soil layers	2	3	22	106/106	inst	kg m <sup>−2</sup>

Soil temperature is defined at the soil depths given in Table 4.7 (column 2). Levels 1 to 8 define the full levels of the soil model. A zero gradient condition is assumed between levels 0 and 1, meaning that temperatures at the surface-atmosphere interface are set equal to the temperature at the first full level depth. (0.5 cm). Temperatures are prognosed for levels 1 to 7. At the lowermost level (1458 cm) the temperature is fixed to the climatological average 2 m-temperature.

Soil moisture W\_SO is prognosed for layers 1 to 6. In the two lowermost layers W\_SO is time constant.

#### 4.3.5 Surface fields interpolated to msl

Table 4.8: *Forecast ( $VV > 0$ ) and initialised analysis ( $VV = 0$ ) products interpolated to msl*

ShortName	Description	Discipline	Category	Number	Lev-Typ 1/2	stepType	Unit
 PMSL	Surface pressure reduced to msl	0	3	1	101/–	inst	Pa

<sup>2</sup>Planned, but not yet available

**Table 4.7:** *Soil model: vertical distribution of levels and layers*

level no.	depth [cm]	layer no.	upper/lower bounds [cm]
0	0.0		
1	0.5	1	0.0 — 1.0
2	2.0	2	1.0 — 3.0
3	6.0	3	3.0 — 9.0
4	18.0	4	9.0 — 27.0
5	54.0	5	27.0 — 81.0
6	162.0	6	81.0 — 243.0
7	486.0	7	243.0 — 729.0
8	1458.0	8	729.0 — 2187.0
