1 ICON Namelists

1.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the grid generation and the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in <icon home>/build/<architecture>/bin/.

Table 1: Namelist files

Namelist file	Purpose	Made by script	Used by program

1.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- *Type* refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- *Default* is the preset value, if defined, that is assigned to this parameter within the programs.
- *Unit* shows the unit of the control parameter, where applicable.
- *Description* explains in a few words the purpose of the parameter.
- *Scope* explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

3.23 nwp_phy_nml

The switches for the physics schemes and the time steps can be set for each model domain individually. If only one value is specified, it is copied to all child domains, implying that the same set of parameterizations and time steps is used in all domains. If the number of values given in the namelist is larger than 1 but less than the number of model domains, then the settings from the highest domain ID are used for the remaining model domains. If the time steps are not an integer multiple of the advective time step (dtime*iadv_rcf), then the time step of the respective physics parameterization is automatically rounded to the next higher integer multiple of the advective time step.

3.25 output_nml

Please note: There may be several instances of output_nml in the namelist file, every one defining a list of variables with separate attributes for output.

Parameter	Type	Default	Unit	Description	Scope
dom(:)	I	-1		Array of domains for which this name-list is used. If not specified (or specified as -1 as the first array member), this name-list will be used for all domains. Attention: Depending on the setting of the parameter l_output_phys_patch these are either logical or physical domain numbers!	
file_interval	C	' '		Defines the length of a file in terms of an ISO-8601 duration string. An example for this time stamp format is given below. This namelist parameter can be set instead of `steps_per_file`.	
filename_format	C	see description.		Output filename format. Includes keywords `path`, `output_filename`, `physdom`, etc. (see below). Default is <output_filename>_DOM<physdom>_<levtype>_<jfile>	
filetype	I	4		One of CDI's FILETYPE_XXX constants. Possible values: 2 (=FILETYPE_GRB2), 4 (=FILETYPE_NC2), 5 (=FILETYPE_NC4)	
h_levels(:)	R	None	m	height levels Not yet implemented. The height levels are currently always taken from array zlevels in namelist nh_pzlev_nml.	

Parameter	Type	Default	Unit	Description	Scope
hl_varlist(:)	C	None		Name of height level fields to be output.	
i_levels(:)	R	None	K	isentropic levels Not yet implemented. The isentropic levels are currently always taken from array ilevels in namelist nh_pzlev_nml.

ml_varlist(:)	C	None		Name of model level fields to be output.	
mode	I	2		1 = forecast mode, 2 = climate mode In climate mode the time axis of the output file is set to TAXIS_ABSOLUTE. In forecast mode it is set to TAXIS_RELATIVE. Till now the forecast mode only works if the output is at multiples of 1 hour	
north_pole(2)	R	0,90		definition of north pole for rotated lon-lat grids.	
output_bounds(3)	R	None		Post-processing times (in seconds): start, end, increment. We choose the advection time step matching or following the requested output time. See namelist parameters `output_start`, `output_end`, `output_interval` for an alternative specification of output events.	
output_filename	C	None		Output filename prefix (which may include path). Domain number, level type, file number and extension will be added, according to the format given in namelist parameter “filename_format”.	
output_grid	L	.FALSE.		Flag whether grid information is added to output.

Parameter	Type	Default	Unit	Description	Scope
output_interval	C	' '		ISO8601 time stamp for repeating output intervals. We choose the advection time step matching or following the requested output time. An example for this time stamp format is given below. See namelist parameter `output_bounds` for an alternative specification of output events.

p_levels(:)	R	None	hPa	pressure levels Not yet implemented. The pressure levels are currently always taken from array plevels in namelist nh_pzlev_nml.	
pl_varlist(:)	C	None		Name of pressure level fields to be output.	
ready_file	C	'default'		A *ready file* is a technique for handling dependencies between the NWP processes. The completion of the write process is signalled by creating a small file with name `ready_file`. Different `output_nml`'s may be joined together to form a single ready file event. The setting of `ready_file = "default"` does not create a ready file. The ready file name may contain string tokens `<path>`, `<datetime>`, `<ddhhmmss>` which are substituted as described for the namelist parameter `filename_format`.	
reg_def_mode	I	0		Specify if the "delta" value prescribes an interval size or the total *number* of intervals: 0: switch automatically between increment and no. of grid points, 1: `reg_lon/lat_def(2)` specifies increment, 2: `reg_lon/lat_def(2)` specifies no. of grid points.	remap=1

Parameter	Type	Default	Unit	Description	Scope
reg_lat_def(3)	R	None		start, increment, end latitude in degrees. Alternatively, the user may set the number of grid points instead of an increment. Details for the setting of regular grids is given below together with an example.	remap=1
reg_lon_def(3)	R	None		The regular grid points are specified by three values: start, increment, end given in degrees. Alternatively, the user may set the number of grid points instead of an increment. Details for the setting of regular grids is given below together with an example.	remap=1
remap	I	0		interpolate horizontally, 0: none, 1: to regular lat-lon grid	
steps_per_file	I	-1		Max number of output steps in one output file. If this number is reached, a new output file will be opened.	
steps_per_file_inclfirst	L	see descr.		Defines if first step is counted wrt. `steps_per_file` files count. The default is `.FALSE.` for GRIB2 output, and `.TRUE.` otherwise.	
taxis_tunit	I	3		3 = TUNIT_HOUR , 2 = TUNIT_MINUTE Time unit of the TAXIS_RELATIVE time axis. For a complete list of possible values see cdi.inc Till now it only works for taxis_tunit=3	mode=1

Interpolation onto regular grids: Horizontal interpolation onto regular grids is possible through the namelist setting `remap=1`, where the mesh is defined by the parameters

- `reg_lon_def`: mesh latitudes in degrees,
- `reg_lat_def`: mesh longitudes in degrees,
- `north_pole`: definition of north pole for rotated lon-lat grids.

The regular grid points in `reg_lon_def`, `reg_lat_def` are each specified by three values, given in degrees: *start*, *increment*, *end*. The mesh then contains all grid points $start + k * increment <= end$, where k is an integer. Instead of defining an increment it is also possible to prescribe the number of grid points.

- Setting the namelist parameter `reg_def_mode=0`: Switch automatically from increment specification to no. of grid points, when the `reg_lon/lat_def(2)` value is larger than 5.0.
- 1: `reg_lon/lat_def(2)` specifies increment
- 2: `reg_lon/lat_def(2)` specifies no. of grid points

For longitude values the last grid point is omitted if the end point matches the start point, e.g. for 0 and 360 degrees.

Examples

local grid with 0.5 degree increment:	`reg_lon_def = -30.,0.5,30.` `reg_lat_def = 90.,-0.5, -90.`
global grid with 720x361 grid points:	`reg_lon_def = 0.,720,360.` `reg_lat_def = -90.,360,90.`

Time stamp format: The namelist parameters `output_start`, `output_end`, `output_interval` allow the specification of time stamps according to ISO 8601. The general format for time stamps is `YYYY-MM-DDThh:mm:ss` where `Y`: year, `M`: month, `D`: day for dates, and `hh`: hour, `mm`: minute, `ss`: second for time strings. The general format for durations is `PnYnMnDTnHnMnS`. See, for example, `http://en.wikipedia.org/wiki/ISO_8601` for details and further specifications.

NOTE: as the mtime library underlaying the output driver currently has some restrictions concerning the specification of durations:

1. Any number `n` in `PnYnMnDTnHnMnS` must have two digits. For instance use `"PT06H"` instead of `"PT6H"`
2. In a duration string `PnyearYnmonMndayDTnhrHnminMnsecS` the numbers `nxyz` must not pass the carry over number to the next larger time unit: 0<=nmon<=12, 0<=nhr<=23, 0<=nmin<=59, 0<=nsec<=59.999. For instance use `"P01D"` instead of `"PT24H"`, or `"PT01M"` instead of `"PT60S"`.

Soon the formatting problem will be resolved and the valid number ranges will be enlarged. (2013-12-16).

Examples

date and time representation (`output_start`, `output_end`)	`2013-10-27T13:41:00Z`
duration (`output_interval`)	`P00DT06H00M00S`

Variable Groups: Using the "group:" keyword for the namelist parameters ml_varlist, hl_varlist, pl_varlist, sets of common variables can be added to the output:

group:all	output of all variables (caution: do not combine with mixed vertical interpolation)
group:atmo_ml_vars	basic atmospheric variables on model levels
group:atmo_pl_vars, group:atmo_zl_vars	same set as atmo_ml_vars, but except pres and height, respectively
group:nh_prog_vars	additional prognostic variables of the nonhydrostatic model
group:atmo_derived_vars	derived atmospheric variables
group:rad_vars	
group:precip_vars	
group:cloud_diag	
group:pbl_vars	
group:phys_tendencies	
group:land_vars	
group:multisnow_vars	tile-averaged variables

Keyword substitution in output filename (filename_format):

path	substituted by model_base_dir
output_filename	substituted by output_filename
physdom	substituted by physical patch ID
levtype	substituted by level type “ML”, “PL”, “HL”, “IL”
levtype_l	like levtype, but in lower case
jfile	substituted by output file counter
datetime	substituted by ISO-8601 date-time stamp in format YYYY-MM-DDThh:mm:ss.sssZ
datetime2	substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmssZ
datetime3	substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmss.sssZ
ddhhmmss	substituted by *relative* day-hour-minute-second string

7 Information on vertical level distribution

The hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coorindates. The hybrid level specification is stored in <icon home>/hyb_params/HYB_PARAMS_<nlev>. The **hydrostatic** model assumes to get **pressure based** coordinates, the **nonhydrostatic** model expects **height based** coordinates. For further information see <icon home>/hyb_params/README.

8 Changes incompatible with former versions of the model code

Change:	**var_names_map_file, out_varnames_map_file**
Date of Change:	**2013-04-25**
Revision:	**12016**

- Renamed **var_names_map_file** → **output_nml_dict**.
- Renamed **out_varnames_map_file** → **netcdf_dict**.
- The dictionary in *netcdf_dict* is now reversed, s.t. the same map file as in output_nml_dict can be used to translate variable names to the ICON internal names and back.

Change:	**output_nml: namespace**
Date of Change:	**2013-04-26**
Revision:	**12051**

- Removed obsolete namelist variable **namespace** from **output_nml**.

Change:	**gribout_nml: generatingCenter, generatingSubcenter**
Date of Change:	**2013-04-26**
Revision:	**12051**

- Introduced new namelist variables **generatingCenter** and **generatingSubcenter**.
- If not set explicitly, center and subcenter information is copied from the input grid file

> *Change:* **radiation_nml: albedo_type**
> *Date of Change:* **2013-05-03**
> *Revision:* **12118**

- Introduced new namelist variable **albedo_type**
- If set to 2, the surface albedo will be based on the MODIS data set.

> *Change:* **initicon_nml: dwdinc_filename**
> *Date of Change:* **2013-05-24**
> *Revision:* **12266**

- Renamed dwdinc_filename to dwdana_filename

> *Change:* **initicon_nml: l_ana_sfc**
> *Date of Change:* **2013-06-25**
> *Revision:* **12582**

- Introduced new namelist flag **l_ana_sfc**
- If true, soil/surface analysis fields are read from the analysis fiel dwdfg_filename. If false, surface analyis fields are not read. Soil and surface are initialized with the first guess instead.

> *Change:* **new_nwp_phy_tend_list: output names consistent with variable names**
> *Date of Change:* **2013-06-25**
> *Revision:* **12590**

- temp_tend_radlw → ddt_temp_radlw

Change:	**prepicon_nml, remap_nml, input_field_nml**
Date of Change:	**2013-06-25**
Revision:	**12597**

- Removed the sources for the "prepicon" binary!
- The "prepicon" functionality (and most of its code) has become part of the ICON tools.

Change:	**initicon_nml**
Date of Change:	**2013-08-19**
Revision:	**13311**

- The number of vertical input levels is now read from file. The namelist parameter **nlev_in** has become obsolete in r12700 and has been removed.

Date of Change:	**2013-10-14**
Revision:	**14160**

- The namelist parameter exch_msgsize has been removed together with the option iorder_sendrecv=4.

Change:	**parallel_nml**
Date of Change:	**2013-08-14**
Revision:	**14164**

- The namelist parameter **use_sp_output** has been replaced by an equivalent switch **use_dp_mpi2io** (with an inverse meaning, i.e. we have **use_dp_mpi2io** = **.NOT. use_sp_output**).

Change:	**parallel_nml**
Date of Change:	**2013-08-15**
Revision:	**14175**

- The above-mentioned namelist parameter **use_dp_mpi2io** got the default .FALSE. By this, the output data are sent now in single precision to the output processes.

Change:	**initicon_nml: l_ana_sfc**
Date of Change:	**2013-10-21**
Revision:	**14280**

- The above-mentioned namelist parameter **l_ana_sfc** has been replaced by **lread_ana**. The default is set to .TRUE., meaning that analysis fields are required and read on default. With lread_ana=.FALSE. ICON is able to start from first guess fields only.

Change:	**output_nml: lwrite_ready, ready_directory**
Date of Change:	**2013-10-25**
Revision:	**14391**

- The namelist parameters **lwrite_ready** and **ready_directory** have been replaced by a single namelist parameter **ready_file**, where `ready_file /= 'default'` enables writing ready files.
- Different `output_nml`'s may be joined together to form a single ready file event – they share the same `ready_file`.

Change:	**output_nml: output_bounds**
Date of Change:	**2013-10-25**
Revision:	**14391**

- The namelist parameter **output_bounds** specifies a start, end, and increment of output invervals. It does no longer allow multiple triples.

Change:	**output_nml: steps_per_file**
Date of Change:	**2013-10-30**
Revision:	**14422**

- The default value of the namelist parameter **steps_per_file** has been changed to `-1`.

Change:	**run_nml**
Date of Change:	**2013-11-13**
Revision:	**14759**

- The dump/restore functionality for domain decompositions and interpolation coefficients has been removed from the model code. This means, that the parameters
  - `ldump_states`,
  - `lrestore_states`,
  - `ldump_dd`,
  - `lread_dd`,
  - `nproc_dd`,
  - `dd_filename`,
  - `dump_filename`,
  - `l_one_file_per_patch`

  have been removed together with the corresponding functionality from the ICON model code.

Change:	**output_nml: filename_format**
Date of Change:	**2013-12-02**
Revision:	**15068**

- The string token `<ddhhmmss>` is now substituted by the *relative* day-hour-minute-second string, whereas the absolute date-time stamp can be inserted using `<datetime>`.

> *Change:* **output_nml: ready_file**
> *Date of Change:* **2013-12-03**
> *Revision:* **15081**

- The ready file name has been changed and may now contain string tokens `<path>`, `<datetime>`, `<ddhhmmss>` which are substituted as described for the namelist parameter `filename_format`.

> *Change:* **interpl_nml: rbf_vec_scale_ll**
> *Date of Change:* **2013-12-06**
> *Revision:* **15156**

- The real-valued namelist parameter `rbf_vec_scale_ll` has been removed.
- Now, there exists a new integer-valued namelist parameter, `rbf_scale_mode_ll` which specifies the mode, how the RBF shape parameter is determined for lon-lat interpolation.

> *Change:* **io_nml**
> *Date of Change:* **2013-12-06**
> *Revision:* **15161**

- Removed remaining vlist-related namelist parameter. This means that the parameters
  - out_filetype
  - out_expname
  - dt_data
  - dt_file
  - lwrite_dblprec, lwrite_decomposition, lwrite_vorticity, lwrite_divergence, lwrite_pres, lwrite_z3, lwrite_tracer, lwrite_tend_phy, lwrite_radiation, lwrite_precip, lwrite_cloud, lwrite_tke, lwrite_surface, lwrite_omega, lwrite_initial, lwrite_oce_timestepping

are no longer available.
