ICON User's Guide

G. Zängl, D. Reinert, F. Prill, M. Giorgetta, L. Kornblueh, L. Linardakis, and S. Rast

assembled and edited by T. Schad, I. Kraut, D. Rieger, C. Walter, S. Gruber, K. Deetz, H. Vogel, and B. Vogel

Karlsruhe Institute of Technology

Institute for Meteorology and Climate Research (IMK-TRO) Hermann-von-Helmholtz-Platz 1 D-76344 Eggenstein-Leopoldshafen

February 19, 2016

Preface

This user guide was assembled and edited based on available documents on the ICON webpage by the persons mentioned at the front page. The content of the user guide follows the requirements of DWD.

Important hints:

In chapter 4 a list of the namelist parameters is given. New and inexperienced users should only modify the namelist parameters that are given in bold letters.

When results produced with ICON are published the following papers have to be cited in the list of references:

Zängl et al. (2014)

Information for authors:

Please read the README for further instructions and tamplates. $\,$

1 Guide for New Users

This tutorial is meant for people with some knowledge and/or experience in modelling and Linux, but which have no experience with the ICON model. In the following we will describe in short how to compile and run ICON on your machine.

1.1 Needed Software

For some components ICON uses external libraries. Therefore you will need some additional software which should be installed on your machine. The following software needed to be installed on your machine:

 NetCDF: NetCDFis a set of software libraries and self-describing, machine-independent data formats that support the creation, access, and sharing of array-oriented scientific data.

(Source: http://www.unidata.ucar.edu/software/netcdf/)

• GRIB: GRIB (GRIdded Binary) is a format defined by the WMO (World Meteorological Organization). The use of GRIB in ICON is optional. The ECMWF GRIB API is an application program interface accessible from C, FORTRAN and Python programs developed for encoding and decoding WMO FM-92 GRIB edition 1 and edition 2 messages. A useful set of command line tools is also provided to give quick access to GRIB messages. ICON requires GRIB2 format.

(Source: https://software.ecmwf.int/wiki/display/GRIB/Home)

- MPI: MPI is a library specification for message-passing, proposed as a standard by a broadly based committee of vendors, implementors, and users.
 (Source: http://www.mcs.anl.gov/research/projects/mpi/)
- OpenMP: Jointly defined by a group of major computer hardware and software vendors, the OpenMP API is a portable, scalable model that gives shared-memory parallel programmers a simple and flexible interface for developing parallel applications on platforms ranging from embedded systems and accelerator devices to multicore systems and shared-memory systems.

(Source: http://openmp.org/wp/)

1.2 The Source Code

You can obtain the source code on the website of DKRZ:

https://www.dkrz.de/

You can use the following commands to untar the ICON source code:

```
tar xfvz icon.tar.gz
```

This will create a folder icon-1.0 inside your current directory. Within the ICON User Guide, this folder will further on be called \$ICONDIR.

1.2.1 Directory structure

Within \$ICONDIR, you will find a set of subdirectories. The important subdirectories are described in the following.

build

Within the \$ICONDIR/build directory, a subdirectory with the name of your computer architecture is created at compilation. Within this subdirectory, a bin subdirectory containing the binary control_model and several further subdirectories containing the compiled module files are created at compilation.

config

Inside the \$ICONDIR/config directory, different machine dependent configuration are stored within the configuration files. You can find a description of how to use and set up such configuration files in chapter 1.3.

data

Within the \$ICONDIR/data directory, you will find divers input datasets. For example, there are the datasets "rrtmg_lw.nc" and "ECHAM6_CldOptProps.nc", which are necessary for the radiation scheme (see sec. 1.6.1).

doc

Within the \$ICONDIR/doc directory, several documentations for ICON are stored. There are according subdirectories for scientific (\$ICONDIR/doc/science), technical (\$ICONDIR/doc/technical) and programming style guides (\$ICONDIR/doc/style).

externals

Within the \$ICONDIR/externals directory, external libraries for ICON are stored. Currently, it is the mtime library which is used to convert different date time formats.

include

Within the \$ICONDIR/include directory, interfaces to libraries needed by ICON are stored. Currently, the interface to the CDI library is stored inside this directory.

run

Within the \$ICONDIR/run directory, namelist descriptor files as well as the full namelist documentation are stored. The namelist descriptor files can be used to generate runscripts. Further information can be found in 1.6.

src

Within the \$ICONDIR/src directory, the source code of ICON including the main program and ICON modules can be found. The modules are ordered in several subdirectories which are described in the following.

The main program control_model.f90 can be found inside the subdirectory \$ICONDIR/src/drivers. Additionally, this directory contains the modules for a hydrostatic and a nonhydrostatic setup.

The configuration of an ICON run is performed within the modules inside \$ICONDIR/src/configure_model and \$ICONDIR/src/namelists. Modules regarding the configuration of idealized test cases can be found inside \$ICONDIR/src/testcases.

The dynamics of ICON are inside \$ICONDIR/src/atm_dyn_iconam and the physical parameterizations inside \$ICONDIR/src/atm_phy_nwp. Parameterizations for the interactions with the surface can be found inside \$ICONDIR/src/lnd_phy_nwp.

Shared infrastructure modules for 3-D and 4-D variables can be found within \$ICONDIR/src/shared. The according routines for 2-D fields (e.g. external parameters) are stored within \$ICONDIR/src/shr_horizontal.

Modules handling the parallelization can be found in \$ICONDIR/src/parallel_infrastructure.

Input and output modules are stored in \$ICONDIR/src/io.

The modules for the grid generator, as described in chapter 1.8 can be found inside \$ICONDIR/src/grid_generator.

support

Within the \$ICONDIR/support directory, the CDI library is stored.

vertical_coord_table

Inside the \$ICONDIR/vertical_coord_tables directory, information files describing the relation between model layer and height are stored.

1.3 Configuration and Compilation

To ease up the compilation a configure-file is provided which should take over the main work. This Autoconf configuration is used to analyze the computer architecture (hardware and software) and set user specified preferences, e.g. the compiler. This preferences are read from config/mh-<0S>, where <0S> is the identified operating system. Operating systems are listed in the configure-files in \$ICONDIR/config/ with the according files mh-<0S>. If your machine is not listed you can add a config-file with your own <0S> based on the given mh-<0S> files. If different compilers are available, the mh-<0S> file may contain a case construct to distinguish them. If your <0S> is not recognized but is one of the listed <0S> you can invoke the configure file with the according option --host=\$HOST. Examples for the DWD CRAY system are given in the boxes.

1.3.1 Description of the Configuration Files

To add a specific compiler or change your compiler flags, you have to enter the \$ICONDIR/config/mh-<OS> according to your operating system <OS>. For the DWD CRAY, the compiler flags in mh-linux look like the following:

```
CRAY EXAMPLE: Compiler Flags inside mh-linux
    config_compiler=cray
        CC
   FC
                = ftn
                = "$FC"
   F77
                = -v -D__LOOP_EXCHANGE -D__MIXED_PRECISION -Df2cFortran
   FFLAGS
-e Z -em -hflex_mp=conservative -hfp1 -hadd_paren -r am -Ktrap=divz,ovf
    CFLAGS
                = -I${GRIB_API}/include -v -Df2cFortran
-DHAVE_CF_INTERFACE -DHAVE_LIBNETCDF -DHAVE_LIBGRIB
-DHAVE_LIBGRIB_API -O3 -D__SVN_VERSION="${SVNVERSION}"
                = "$FFLAGS"
   F77FLAGS
                = "-v"
    FCLIBS
    GEN_FLAGS
    FDEBUG
                = -g -R abc
    OMPFLAG
                = -mp
   DEFOPT
                = -D
   DEFCOPT
                = -D
   MODOPT
                = -I
   MODDIR
    ;;
```

The cray) in this example gives the name of this specific configuration. It can be addressed by a flag at configuration. For this example, the according command to choose this setting would be ./configure --with-fortran=cray (see section 1.3.2). Like this, you can create your own configuration by adding a new compiler.

CC, FC and F77 are the compiler directives for C-Compiler, FORTRAN2003-Compiler and FORTRAN77-Compiler. The according compiler flags are set via CFLAGS, FFLAGS and F77FLAGS. The variable to set an OpenMP flag is called OMPFLAG. Libraries are set via FCLIBS.

1.3.2 Configuring and Compiling the Code

To configure the source code go to \$ICONDIR and give:

```
./configure
./build_command
```

If you want to use another compiler than the default compiler you give:

```
./configure --with-fortran=<compiler>
./build_command
```

where <compiler> is {gcc,nag,intel,pgi,cray}.

```
CRAY EXAMPLE: Configure + Make
./configure --with-fortran=cray}
./build_command
```

Note, that CRAY compiler environment (cce) versions 8.2.x do not work with ICON. The CRAY configuration is expanded to the following:

```
CRAY EXAMPLE: Configuration

ftn -I../module -v -D__LOOP_EXCHANGE -D__MIXED_PRECISION -Df2cFortran -e

Z -em -hflex_mp=conservative -hfp1 -hadd_paren -r am -Ktrap=divz,ovf

-D__ICON__ <object files> -L/usr/local/pkg/grib_api/1.11.0/CRAY/lib

-L../lib -lsupport -lgrib_api_f90 -lgrib_api -lmtime $(LAPACK_LIB)

$(NETCDF_LIB) $(HDF5_LIB) $(SZIP_LIB) $(ZLIB_LIB) $(MPI_LIB)

$(PROFILE_LIB) $(SCT_LIB)
```

ICON is parallelized using MPI and OpenMP. You can control the parallelization to be used by giving:

```
./configure --with-mpi/--without-mpi --with-openmp/--without-openmp ./build_command
```

By default the options are set to --with-mpi --without-openmp. After a successful build, you will find the ICON executable named control_model inside \$ICONDIR/build/<0S>/bin/. The CRAY Fortran compiler is an exception, as the command includes automatically OpenMP. Therefore, although selecting -without-openmp, OpenMP is used.

If you wish to re-configure ICON it is advisable first to clean the old setup by giving:

make distclean

Some more details on configure options can be found in the help of the configure command:

./configure --help

1.4 Running the model (Test scripts for ICON)

1.4.1 Principles of testing ICON

The ICON developers use the buildbot tool in order to perform automated tests on selected ICON experiments at regular time intervals. The buildbot tool launches the respective test scripts on various computer platforms and documents success or failure on a special web site (https://buildbot.zmaw.de/icon/). The automated tests are performed on the newest model revision as available in the ICON repository. Furthermore, tests can be "forced", i.e. started by hand, at any time specifying a certain experiment and model revision of any branch of the repository. However, it is impossible to test two revisions against each other or to test a local revision. Here, we present new tests for ICON into which various experiments are integrated and which are designed such that they can either be used in the framework of the buildbot tool or be started manually without reference to buildbot (e.g. on a PC at MPI Hamburg). The tests are designed to trap certain technical errors and comprise the following experiments:

base test: Just a simple base run over a short time period for a specific experiment. This run will be called simulation A in the following.

update test: In addition to the model revision to test, the so-called "test revision", a "reference revision" can be specified. A short simulation A of the test revision over one hour is performed during which restart files are written. The same simulation is performed for the reference revision (simulation A'). The "update test" is said to be passed if there are no differences in the output of simulation A and A' using the "cdo diff" command on the time steps in the output specified by the user.

restart test: In addition to a base simulation A, a second simulation B restarts ICON at some time after the initial date. The "restart test" is said to be passed if there are no differences in the output for the time steps after the restart between the original and the restarted simulation using the "cdo diff" command.

nproma test: The nproma test performs a base simulation A and a simulation C with a different value of nproma. Instead of nproma of simulation A, a value of 17 is used in

simulation C or, if nproma = 17 for simulation A, nproma = 19 is used for simulation C. The nproma test is said to be passed if the "cdo diff" command does not find differences in the output.

mpi parallel test: The mpi parallel test performs a base simulation A and a simulation D with a reduced number of MPI threads compared to the base simulation A. If more than one threads are used on each node, the number of threads on each node is reduced by one. If only one thread is used on each node, the number of nodes is reduced by one. If only one process is used, no mpi parallel test is performed. The parallel test is said to be passed if the "cdo diff" command does not find differences between the output files.

openmp parallel test: The openmp parallel test performs a base simulation A and a simulation E with a reduced number of openmp threads compared to the base simulation A. If only one openmp thread was used, no openmp test is performed. The openmp parallel test is said to be passed if the "cdo diff" command does not find differences between the output files.

The testing procedure is such that tests can be combined. Furthermore, the test script can be asked to re—use existing runs without repeating these runs.

Only the following experiments are included into the test script:

atm_amip_test: Non-hydrostatic AMIP-like simulation but with transient solar irradiance using ECHAM physics.

atm_icoles_nested: Nonhydrostatic atmosphere only simulation with a regional grid refinement.

atm_jww_hs_test: Jablonowski Williamson baroclinic wave test for a hydrostatic atmosphere.

oce_omip_0160km: Ocean only experiment with a 160km resolution.

1.4.2 Description of test script

The test script icon-dev.checksuite is located in the run/checksuite.icon-dev directory of ICON and uses the following run script of the run directory for the experiments: (i) exp.atm_amip_test for the AMIP-type experiment atm_amip_test, (ii) exp.atm_icoles_nested for the atmosphere experiment with a grid refinement, (iii) exp.atm_jww_hs_test for the Jablonowski Williamson baroclinic wave test, and (iv) exp.oce_omip_0160km for the ocean only experiment oce_omip_0160km.

These run scripts contain all necessary namelist groups and links to files that contain the initial and boundary conditions. By the standard make_runscripts command invoked inside icon-dev.checksuite, this script is transformed into the actually used form that contains an additional suffix .run at the end of its name. Attention: icon-dev.checksuite generates the specific run script by default and overwrites those that are present. The script can be forced to use present runscripts. For the various test runs for each experiment, these .run files are copied and edited by sed.

Here follows a more detailed description of the script:

- icon-dev.checksuite: This script uses the make_runscripts command to produce exp.<exp_name>.run from the basic run script exp.<exp_name>. The default is that any existing run script is overwritten but there is an option to keep existing runscripts. These run scripts are then modified by sed commands in order to perform the various test runs. Once the test runs are finished, the function diff_results of icon-dev.checksuite is called to determine the differences between those runs.
- exp.<experiment>: These scripts contain all settings for the base simulation in one experiment. To date, the experiments <experiment> = atm_amip_test, atm_icoles_nested, atm_jww_hs_test, and oce_omip_160km can be used in the tests. The base script exp.<experiment> will be transformed by make_runscripts into a script that can actually run the ICON model. The resulting exp.<experiment>.run scripts will then be copied to exp.<experiment>_base.run, exp.<experiment>_restart.run, exp.<experiment>_nproma.run, exp.<experiment>_mpi.run, and exp.<experiment>_omp.run to perform simulations A, B, C, D, and E, described in section 1.4.1, respectively. The latter scripts are then modified by icon-dev.checksuite using sed according to the needs of the respective runs.
- diff_results. This function compares two simulations. The five arguments contain the base path of the model (.../icon-dev/ for example), and the name of the experiment to be compared (e.g. <experiment>_base) for the two experiments, respectively. The path of the models can be identical (e.g. for the restart or nproma tests that are performed on the same model revision). The fifth argument is the name of the test (update, restart, nproma, mpi, omp) and is only used to produce more legible output. However, the diff_results function needs further information that is provided by variables that are set in the main script: (i) the respective infix of the output files in variable TYPES (e.g. atm_phy), the output dates and time in variable DATES (e.g. 19780101T004000Z) as they figure on the output filenames, and the restart date in RESTART_DATE. These three variables can be set as arguments to the options -t, -d, and -s in a call to icon-dev.checksuite, respectively. The diff_results function checks for differences between two experiments by the cdo diff command. If the variable SUB_FILES is set to 'yes', e.g. by the use of the -u option in the call of icon-dev.checksuite, the variables of the respective outputfiles are subtracted from each other resulting in difference files

diff_<EXP2>_<TYPE>_<DATE>-<EXP1>_<TYPE>_<DATE>.nc
for <TYPE> in TYPES and <EXP[12]> one of <experiment>_base,
<experiment>_restart, <experiment>_nproma, <experiment>_mpi,
<experiment>_openmp, or <experiment>_update. The difference files are written to
the path of experiment EXP2.

1.4.3 Usage

There are three different ways to use the "check suite":

(i) Start on the command line: The test script icon-dev.checksuite can be called on the command line from the run/checksuite.icon-dev directory. All the below described options are available on the command line and the full functionality can be used via the command line options easily.

- (ii) Submit to queue: Like buildbot does, it is possible to run make_runscripts on a respective test experiment script located in icon_dev/run and to submit the resulting run script to the respective queuing system. E.g. from exp.test_atm_amip, the runscript exp.test_atm_amip.run is generated and can be submitted. exp.test_atm_amip is just a link to checksuite.icon-dev/check.atm_amip. In order to use the full functionality of icon-dev.checksuite, various environment variables have to be set in exp.test_atm_amip. This way of calling run/checksuite.icon-dev is good for testing on computers with a queuing system. To date, the exp.test_atm_amip and exp.check_oce_omip_160km are the only test scripts that are available.
- (iii) Buildbot: The script calling icon-dev.checksuit can be used by buildbot. In this case, it is important to check that the correct values of all the environment variables are set in the run scripts mentioned in paragraph (ii).

The calling syntax of icon-dev.checksuite is:

Description of options:

- -c: colour line output. Colour output should not be used when the script is called by build-bot.
- -d: dates for which outputfiles exist. The default depends on the experiment.
- -e: experiment on which tests have to be performed. Currently, the non-hydrostatic amip-like experiment atm_amip_test, the atmospheric experiment including a grid refinement atm_icoles_0160km, the Jablonowski Williamson baroclinic wave test on a hydrostatic atmosphere atm_jww_hs_test, and the ocean only experiment oce_omip_0160km are supported.
- -f: The argument yes forces to create run scripts even if they already exist (default), no creates run scripts only if they are not yet present.
- -h: display help
- -m: describes the test mode by its arguments that are one of b(ase), u(pdate), r(estart), n(proma), m(pi), o(mp), ur, un, um, uo, rn, rm, ro, nm, no, mo, urn, urm, uro, unm, uno, umo, rnm, rno, rmo, nmo, urnm, urno, urmo, unmo, rnmo, urnmo. The first five tests modes describe the sole base run, or the update—, restart—, nproma—, mpi—, and omptests, respectively. The last 26 acronyms describe combined tests where each single test is represented by its initial letter. The default test mode is rnmo.
- -o: The argument of this option can be either yes or no depending on whether existing test simulations shall be overwritten (-o yes) or will be re—used for the current tests (-o no). The default is -o yes, so all existing experiments are automatically overwritten if not specified otherwise.

- -r: The argument of this option gives the absolute path to the reference model. If the test mode includes an update test, it is mandatory. No default.
- -s: Restart date for the restart test as given by the time settings in the respective experiment.

 Default depends on the experiment.
- -t: "Types" (infixes) of output files that have to be compared. The infixes depend on the experiment and are set by default accordingly.
- -u: If files in the various test runs differ, calculate the difference by cdo sub.

Corresponding to the options on the command line, the following environment variables can be set in the exp.test_<experiment>:

```
-c: COLOUR='yes'|'no'. Not recommended in use with buildbot.
```

```
-d: DATES=<date_string>.
```

```
-e: EXPERIMENT=<name>.
```

```
-f: FORCE_MRS='yes'|'no'
```

```
-m: MD=<test_mode>
```

```
-o: OVERWRITE='yes'|'no'
```

-r: REFERENCE=<reference_model_path>

```
-s: RESTART_DATE=<restart_date>
```

-t: TYPES=<file_type_infixes>

-u: SUB_FILES='yes'|'no'

1.4.4 Examples

```
icon-dev.checksuite -o no -c -u -e oce_omip_160km
```

This command runs the rnmo, i.e. the restart, nproma, mpi and openmp test on the experiment oce_omip_160km. Existing runs are not overwritten (-o no), there is colour output (-c), and the difference files are calculated between the various test experiments and the base run (-u).

```
icon-dev.checksuite -c -f no -m ur -r <path>
```

This command performs the update and restart test (-m ur) on the atm_amip_test experiment, colour output ist switched on (-c), the reference model is given in <path>, the runscripts are not newly generated if they are already there (-f no).

1.5 Running the Model (Idealized Cases)

To shed light on the functionality and the quality of the dynamical core, setups for two test cases are presented in the following. Additionally, results of these test cases are shown. These tests are classified in short deterministic test cases (typically a simulation period of about 10-30 days) and tests in a climate mode (typically a multi-year period). This section concentrates on the first class, which starts from prescribed initial conditions (ideally provided in analytic form). The simulation results are either compared to analytic solutions (if available) or high-resolution reference solutions. For a list of available testcases, the reader is referred to the namelist section (4).

1.5.1 Jablonowski-Williamson test

The Jablonowski-Williamson Test (Jablonowski and Williamson, 2006) is a standard test for dynamical cores in global models and can be run for dry dynamics only - as it is intended for- but full physics can be also tested.

Input von Daniel Reinert is expected here.

Setup

For full physics, two additional namelist parameters are introduced in the testcase_nml to control the initial moisture in the atmosphere:

- Here rh_at_1000hpa to be set between 0 and 1. The default is set to 0.7 which gives a quite smooth start. If you really want to see early onsets of convection and microphysics you have to tune this parameter.
- qv_max is usually set to 20.e 3kg/kg and refers to the maximum value in the tropics.

Input Data

GRID

Results

The Jablonowski-Williamson steady-state test is based on a zonally symmetric, strongly baroclinic atmosphere. Initially, it is in a hydrostatic and geostrophic balance and therefore should remain stationary if no perturbation is imposed. Grid irregularities can disturb this stationary conditions and hence the test identifies the presence and magnitude of grid imprinting of a numerical model. For the Jablonowski-Williamson baroclinic wave test, a weak (and unbalanced) perturbation disturbs the initial wind. This test highlights the diffusivity (or effective resolution) of a dynamical core and the presence of phase speed errors in the advection of poorly resolved structures.

1.5.2 Mountain induced Rossby waves

In order to test the model dynamics in dry stage but with real or any complex topography one can choose the mountain induced Rossby wave test case and select different types of topography. The following namelist parameters give an example how to perform such an idealized simulation.

```

output
```

Initial conditions

Applying this namelist parameters the topography shown in Fig. 1.1 is used.

The v-component of the wind speed is is initialized with zero at all grid points, the initial conditions for the u-component are shown in Fig. 1.2.

Results after 16 days

The u-component after sixteen days of simulation at 700 hPa is shown in Fig. 1.3, the corresponding v-component is shown in Fig. 1.4, and Fig. 1.5 shows the vorticity.

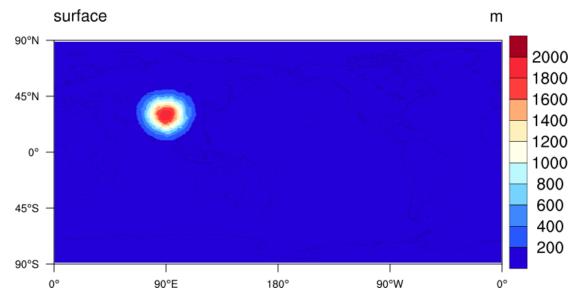

Figure 1.1: Topography of the test case

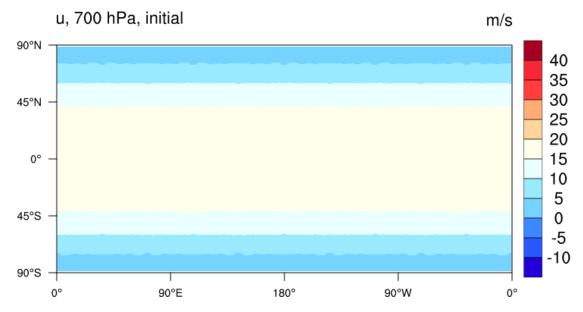

Figure 1.2: Spatial distribution of the initialized u-component at 700 hPa

Input Data

With the exception of the grid file no further input files are necessary.

1.5.3 cr2016_02_16_rjs: Aqua planet in ICON

The Aqua Planet Experiment (APE) is incorporated in ICON as a set of testcases, all of them having in common that the bottom boundary consists of water only, with all land surface and orography being removed. Originally APEs where constructed as a test-bed for model intercomparison regarding the interaction of dynamics and physical parameterizations in atmospheric General Circulation Models (GCMs) ??. However, this idealized setup is also

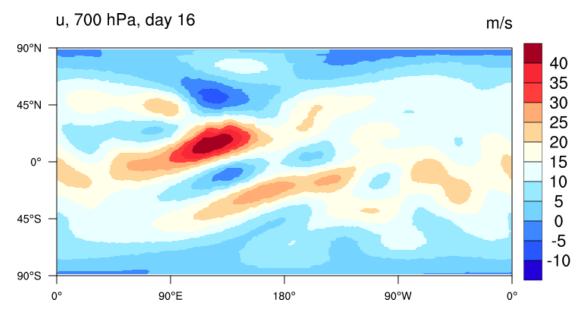

Figure 1.3: Spatial distribution of u-component after 16 days of simulation at 700 hPa

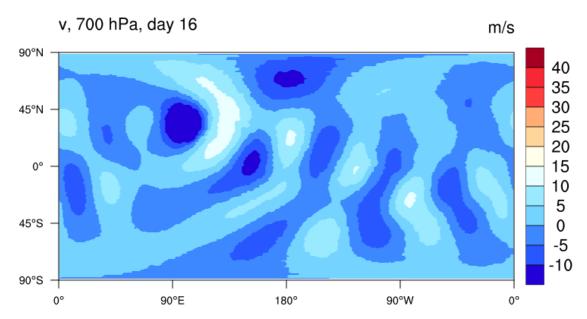

Figure 1.4: Spatial distribution of v-component after 16 days of simulation at 700 hPa

well suited for studies focusing on the interaction of basic atmospheric phenomena and the ocean surface, e.g. tropical convection, when a realistic representation of the atmosphere is secondary.

The APE model is one of the test cases of ICON and can be switched on by setting the respective nh_test_name variable in the nh_testcase_nml namelist, see listing 1.1.

Sea Surface Temperatures (SSTs) can either be prescribed by one of several analytical functions and kept constant in time, or alternatively SSTs may interact with the atmosphere by the use of a slab ocean layer. The slab ocean is not tested yet. The following SSTs are available from mo_ape_params.f90 ($T_m = 273.15\,\mathrm{K}$):

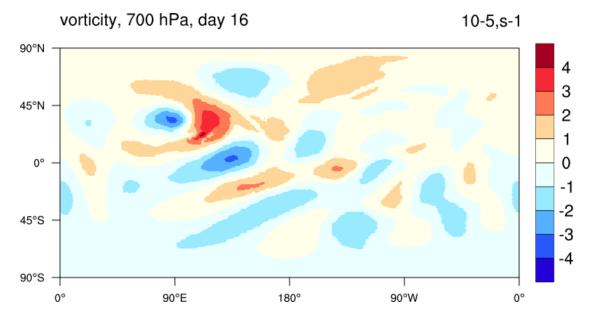

Figure 1.5: Spatial distribution of the vorticity after 16 days of simulation at 700 hPa

keyword sst1

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + 27 \,\text{K} \left(1 - \left(\sin(3\phi/2) \right)^2 \right) & \text{for all } -\pi/3 < \phi < \pi/3 \\ T_{\text{m}} & \text{otherwise} \end{cases}$$
(1.1)

keyword sst2

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + 27 \,\text{K} \left(1 - \frac{3}{\pi} |\phi| \right) & \text{for all } -\pi/3 < \phi < \pi/3 \\ T_{\text{m}} & \text{otherwise} \end{cases}$$
(1.2)

keyword sst3

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + 27 \,\text{K} \left(1 - \left(\sin(3\phi/2) \right)^4 \right) & \text{for all } -\pi/3 < \phi < \pi/3 \\ T_{\text{m}} & \text{otherwise} \end{cases}$$
(1.3)

keyword sst4: This distribution has its temperature peak at 5°N:

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + 27 \,\text{K} \left(1 - \left(\sin(1.6363(\phi - \frac{\pi}{36})) \right)^2 \right) & \text{for all} \quad \pi/36 < \phi < \pi/3 \\ T_{\text{m}} + 27 \,\text{K} \left(1 - \left(\sin(1.3846(\phi - \frac{\pi}{36})) \right)^2 \right) & \text{for all} \quad -\pi/3 < \phi \le \pi/36 \\ T_{\text{m}} & \text{otherwise} \end{cases}$$

$$(1.4)$$

keyword sst_qobs

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + \frac{27}{2} \,\text{K} \left(2 - \left(\sin(3\phi/2) \right)^2 \left(1 + \left(\sin(3\phi/2) \right)^2 \right) \right) & \text{for all } -\pi/3 < \phi < \pi/3 \\ T_{\text{m}} & \text{otherwise} \end{cases}$$
(1.5)

keyword sst_ice

$$T_{\text{surf}} = \begin{cases} T_{\text{m}} + 1.9 \,\text{K} + 27 \,\text{K} \left(1 - \left(\sin(3\phi/2) \right)^2 \right) & \text{for all } -\pi/3 < \phi < \pi/3 \\ T_{\text{m}} - 1.9 \,\text{K} & \text{otherwise} \end{cases}$$
(1.6)

keyword sst_const

$$T_{\text{surf}} = T_{\text{m}} + 27 \,\text{K} \tag{1.7}$$

The various SSTs can be set in the namelist nh_testcase_nml by attributing the corresponding keyword to the variable ape_sst_case, e.g.

Listing 1.1: Testcase namelist for APE (exp.atm_ape_test)

The APE can be conducted with the MPI/ECHAM physics only since the use of the PSRAD radiation is is essential for the APE. A standard example script <code>exp.atm_ape_test</code> is provided. In this standard version, a Kepler orbit with no eccentricity and zero obliquity is used. The orbit parameters are set in the <code>psrad_orbit_nml</code> namelist:

Listing 1.2: Orbit namelist for APE (exp.atm_ape_test)

```
&psrad_orbit_nml
cecc = 0.0    ! zero excentricity
cobld = 0.0    ! zero obliquity
l_orbvsop87 = .FALSE.    ! use Kepler orbit instead of historic
    one
//
```

If a Kepler orbit is used, a year with months of a different number of days does not make sense. Instead, a 360 day year should be used. The calendar must be set by two variables at the beginning of the exp.atm_ape_test script:

```
Listing 1.3: Calendar for APE (exp.atm_ape_test)
```

```
calendar="'360 day year'"
calendar_type=2
```

The solar irradiation is set to the preindustrial value, i.e. a total solar irradiation of $1360.875 \,\mathrm{W/m^2}$. The composition of the atmosphere uses a special file for the O_3 concentration, prognostic water vapour and prognostic liquid and ice cloud water, constant CO_2 , and no aerosols. All other greenhouse gases are set to zero.

Listing 1.4: Solar irradiation and composition of atmosphere (exp.atm_ape_test)

```
&radiation_nml
isolrad = 2 ! preindustrial solar constant of 1360.875 W/m^
    at 1 AE
irad_h2o = 1 ! prognostic vapor, liquid and ice
irad_co2 = 2 ! constant co2
```

The O₃ concentrations are provided in the file ape_o3_iconR2B04-ocean_aqua_planet.nc that is provided in the directory data/external/ape_ozone of the ICON main directory. The table 1.1 lists possible ozone files

Table 1.1: Possible ozone file

file name	description	
ape_o3_iconR2B03-ocean_aqua_planet.nc	contains one time step of ozone values, inter-	
	polated from ape_o3_T42_1Pa.nc	
ape_o3_iconR2B04-ocean_aqua_planet.nc	contains one time step of ozone values, inter-	
	polated from ape_o3_T42_1Pa.nc	
ape_o3_R2B04_1Pa_spr0.90-cell.nc	contains the same ozone values as the file above	
ape_o3_R2B04_hex_1Pa_c.nc	unclear, contains 10242 grid points only instead	
	of 20480 as the files for r2b4 resolution	
tor120000s64_ozone_CMIP5_aqua_1870_march.ncone time step on 8192 cells, 36 levels, seems		
	be on a torus grid.	

1.6 Running the Model (Real Case)

The ICON code, as checkout from the SVN repository, does not include runscripts. Instead the run directory (\$ICONDIR/run/) includes several descriptor files for building grids, defining experiments and post-processings. There exist three different types of descriptor files with prefixes grid, exp, post:

- grid.<name>: to configure the grid generator, see chapter 1.8 for more details. It is recommended to use pre-built grids. For details, see section 1.7.
- exp.<name>: to define the namelist, which determinate the experiments.
- post.<name>: to define post-processing.

1.6.1 Input Data

Generally ICON requires the following input data: Grid files, external parameters, initialization (DWD analysis or IFS), input fields for radiation.

Grid Files

In order to run ICON, it is necessary to have the horizontal grid information as an input parameter. This information is stored within so-called grid files. For a ICON run, one global grid file is necessary. Additionally, if you want to nest, grid files of the nested domains are necessary, too. To improve the performance of ICON, a (optional) reduced radiation grid for each domain may be used.

The naming of the ICON-Grid is as follows: The initial icosahedron grid is refined by <n>secting the edges, and further refinement is obtained by iteratively bisecting the created edges. The grid produced at the <k>refining iteration is named "R<n>B<k>". For further details, see the ICON Technical Documentation.

It is recommended to use pre-built grids. Further information can be found in chapter 1.7. For building own grids, the reader is referred to chapter 1.8. The names of the grid files have to be specified within the grid_nml:

```
&grid_nml
dynamics_grid_filename = "<INSERTFILENAME>"
radiation_grid_filename = "<INSERTFILENAME>"
```

External Parameters

ICON requires geographical localized datasets like the topographic height of the earth surface, the plant cover, the distribution of land and sea and, dependent on the schemes used, a variety of other so called external parameters. The EXTPAR software system (EXTPAR - External Parameter for Numerical Weather Prediction and Climate Application) is able to generate external parameters for the different models GME, COSMO, HRM and ICON. The software can run on a UNIX or Linux systems where the raw data is stored. It allows operators (experienced users) running the scripts to create new external parameters controlled by user specifications like the model domain. For a more detailed overview of EXTPAR, the reader is referred to the User and Implementation Guide of EXTPAR.

The name of the EXTPAR file which has to be read by ICON can be specified as follows:

```
&extpar_nml
extpar_filename = "<INSERTFILENAME>"

If not specified explicitly, ICON uses the following file name:
"<path>extpar_<gridfile>".
<path> and <gridfile> are then replaced at runtime by ICON.
```

Initialization

For the initialization of ICON, input data from either DWD or IFS is needed.

In case of DWD (init_mode=1) a first guess and an analysis is required:

```
&initicon_nml
dwdfg_filename = "<INSERTFILENAME>"
dwdana_filename = "<INSERTFILENAME>"
```

If not specified explicitly, ICON uses the following file names:

```
"<path>dwdFG_R<n>B<k>_DOM<idom>.nc" and
```

<path>, <n>, <k> and <idom> are then replaced at runtime by ICON according to the chosen
gridfile (see 1.6.1). The variable <idom> is an index for the domain on which the calculations
are performed. <idom>=0000 is reserved for a reduced radiation grid, <idom>=0001 for the
global domain, higher numbers are used for nested domains. NETCDF as well as GRIB2
input can be used.

In case of IFS (init_mode=2) an analysis is required. It has to be in NetCDF:

```
&initicon_nml
ifs2icon_filename = "<INSERTFILENAME>"
```

If not specified explicitly, ICON uses the following file name:

```
"<path>ifs2icon_R<n>B<k>_DOM<idom>.nc".
```

<path>, <n>, <k> and <idom> are then replaced at runtime by ICON according to the chosen
gridfile (see 1.6.1). The variable <idom> is an index for the domain on which the calculations
are performed. <idom>=0000 is reserved for a reduced radiation grid, <idom>=0001 for the
global domain, higher numbers are used for nested domains.

Radiation

ICON requires input fields for the RRTM radiation scheme. The file names are specified as follows:

```
&nwp_phy_nml
lrtm_filename = "<INSERTFILENAME>"
cldopt_filename = "<INSERTFILENAME>"

If not specified explicitly, ICON uses the following file names:
"rrtmg_lw.nc" and
"ECHAM6_CldOptProps.nc".
```

The files can be found within \$ICONDIR/data.

1.6.2 Creating a Runscript

To create a runscript, new users are advised to use the namelist descriptor file exp.nh-oper which contains recently recommended namelist settings. It might be necessary to account for the file names and paths of the input data. Additionally, machine dependent settings need to be added to this script to obtain a runscript. For some architectures, this step can be performed by using the make runscript environment as shown in 1.6.4. In the following, example settings for DWD CRAY are listed.

[&]quot;<path>dwdana_R<n>B<k>_DOM<idom>.nc".

```
CRAY EXAMPLE: Namelists <<Place your namelists e.g. from exp.nh_oper here>>
```

1.6.3 Restart

A restart of the model requires a restart file that has to be created by a previous model run. In the following the procedures and the corresponding namelist settings are explained.

Creating the initial restart file:

The first job in a series of model runs creates the first restart file. To do so we have to use the following namelist switches.

```
&master_nml
lrestart = .FALSE.
```

In addition we have to prescribe at which time interval the job should produce a restart file:

```
&io_nml
dt_checkpoint = "<Insert time in seconds>"
```

The ICON run then creates restart files for each domain 1, ..., n_dom, and for each restart output time step.

The filenames are generic and look like:

```
"<gridfile>_restart_<modeltype>_<timestamp>.nc",
```

An example would be:

```
"iconR2B06_D0M01_restart_atm_20110101T001200Z.nc" (NetCDF format)
```

This filename can be customized using the namelist parameter:

```
&mo_run_nml
restart_filename = "<INSERTFILENAME>"
```

This file contains:

- data
- namelists
- several attributes

Note: - ICON reads the namelists only once and assumes that these are identical for all domains. - Since we do not know about the total number of domains at startup, we have to ask the current restart file for the attribute "n_dom".

For each domain 1, ..., n_dom, a symbolic link is generated with the generic name:

```
"restart_<modeltype>_DOMxx.nc"
```

Note: - The domain-dependent suffix "...DOMxx" is also required for non-nested setups.

Running the model in the restart mode:

ICON has to be informed that you want to carry out a restart run:

```
&master_nml
lrestart = .TRUE.
```

The generic link "restart_<modeltype>_DOMxx.nc" is used by the restart run to point to the last written restart file of the previous model run.

Chain of restart runs

If a chain of restart runs is foreseen it is recommended to use the namelist parameter dt_restart.

```
&time_nml
dt_restart = "<Insert time in seconds>"
```

In this case only one restart file is produced by each model run and after writing the restart file the job stops.

Note:- dt_restart and dt_checkpoint have to be selected carefully.

Asynchronous restart:

The restart can be handled by separated processors. The number of restart processors can be chosen by the user. The corresponding namelist parameter is:

```
&parallel_nml
num_restart_procs = n
```

n is the number of processors used for restart.

1.6.4 Make Runscript Environment

A full listing of descriptor files you will find in \$ICON/run/.

After configuration and compiling (chapter 1.3) these descriptor files can be transformed into runscripts, which should include the necessary system dependent parameters and the execution section exec.icon (\$ICONDIR/run/exec.iconrun), which starts the actual integration. This transformation is done in \$ICONDIR by:

```
./make_runscripts
```

This transforms every existing descriptor file in \$ICONDIR/run/<type>.<name> into a ready-to-use run script \$ICONDIR/run/<type>.<name>.run

For illustration there exists also

```
./make_my_runscripts
```

which transforms a single descriptor file into a run script. This file is an exemplary file and you can see how to define run parameters.

An exemplary descriptor file for a operational run is exp.nh_oper.

Note: if you change, or create a descriptor you will need to (re)create the run script in order for the changes to take effect.

To run a script <type>.<name>.run, either for creating grids or making an experiment or doing post-processing, go to the ./run folder

cd run

and use the job submission command, which depends on your machine:

```
[<submit>] <type>.<name>.run
```

[<submit>] is something like: {llsubmit,qsub}

Note: <u>Before</u> (!) running an experiment, the ICON grids must be available to the model. For this purpose, either pre-built grids and ExtPar Data can be used (see Sec. 1.7) or create own grids (1.8). For a new user, it is suggested to use pre-built grids first.

1.7 Pre-built Grids and ExtPar Data

A list of grid files has been pre-built for the ICON model together with the corresponding reduced radiation grids and the external parameters.

1. The **primary storage** location for ICON grids is

```
blizzard:/pool/data/ICON/grids/public
```

- 2. Every 24h the contents of the primary storage directory are mirrored to DWD's HPC.
- 3. Every 24h the contents of the primary storage directory are mirrored to a public web site: http://icon-downloads.zmaw.de.

Each grid file consists of a NetCDF file and a GPG signature file (http://de.wikipedia.org/wiki/GNU_Privacy_Guard).

The signature file makes sure that a grid file is complete and verifies the authorship.

1.7.1 Grid file nomenclature

The grids are identified by

- a **centre** number
- a **subcentre** number
- a numberOfGridUsed which is simply an integer number, increased by one with every new 'official' grid.

The grid files and the external parameter files are named accordingly, e.g.,

```
icon_grid_0001_RxxByy_G.nc
icon_extpar_0001_RxxByy_G.nc
```

where the name components are as follows:

```
icon _ grid _ 0001 _ R 02 B 06 _ R .nc
```

The numberOfGridUsed parameter is part of the file name (0001, ...) and makes this file name unique.

In general, a lookup table is required to find the actual file name to which a set of these parameters corresponds. This 'table file' is located under

```
http://icon-downloads.zmaw.de/dwd_grids.xml
```

(the table file itself is under version control: https://svn.zmaw.de/svn/icon_grid_table).

1.8 Grid Generation

1.8.1 ICON atmosphere grids

The ICON horizontal spherical grid is based on the projection of the icosahedron on the sphere. This is a 2-dimensional grid, representing the earth's surface. The ICON grids need to be created, stored as NetCDF files, and consequently used by the ICON model. Alternatively, already stored grids may be used.

The initial icosahedron grid is refined by <n>-secting the edges, and further refinement is obtained by iteratively bisecting the created edges. The grid produced at the <k>refining iteration is named "R<n>B<k>", and the corresponding NetCDF-file is "iconR<n>B<k>-grid.nc". The grid files, after their creation, are located in the ./grids folder. For more detailed information about horizontal ICON grids the reader is referred to the ICON technical documentation.

Examples of grids are in ./grids. More information can be found in: \$ICONDIR/doc/technical/icon_grid.pdf.

The example given below shows the namelist parameters for generating a global R2B6 grid.

```
EXAMPLE Grid Generation of a R2B6 grid

#!/bin/ksh

#------

# Creation of atmosphere grids for ICON

#------

# ICON grid generator namelist parameters

#

# For a complete list see Namelist_overview and Namelist_overview.pdf

#

# nroot = Number of sections into which the edges of the original icosahedron are divided in the initial refinement step.

# (icosahedron = "grid -1" --> "nroot" grid = grid "O")

#
```

```
# grid_levels = Number of refinement steps applying edge bisection,
#
                follows the initial "nroot" refinement step.
#
                (grid "0" --> grid "1" --> ... --> grid "grid_levels")
#
# itype_optimize grid optimization method applied from grid level 1 onward.
#
                i | optimization | suffix fo grid output file
#
#
                0 | none
                                   l noo
                1 | Heikes Randall | hro
#
                4 | spring dynamics | spr
# beta_spring = Tuning parameter for spring dynamics to be chosen in the
#
               range [0.9,1.1]. Weights the target length between the
#
               grid points.
# First generate graphs
R=2
      # nroot (the first dissection will be a bisection)
B=6
      # highest grid level to reach (number of consequent bisections)
maxlev_optim=6 # highest grid level to apply optimizations
cat > NAMELIST_GRAPH << EOF
&graph_ini
           = \$\{R\}
 nroot
 grid_levels = ${B}
EOF
echo global_graph_generator null > $commandFile
${start} ${run_commmand}
check_error $? "global_graph_generator"
#-----
# Generate grids using the spring dynamics optimization
cat > NAMELIST_GRID << EOF
&grid_ini
           = \$\{R\}
 nroot
 grid_levels = ${B}
&grid_options
 itype_optimize = 4    ! 1 = Heikes-Randall, 4 = spring dynamics
 maxlev_optim = $maxlev_optim ! the maximum level to optimize
EOF
```

ICON gives the possibility to nest subdomain within a parent grid. The example below gives the namelist parameters for generating a nested grid (patch). The root bisection of the patch in this example starts with the fourth level of the bisections of the global model.

```
EXAMPLE Nested grid based on the global grid described before.
#-----
# Next the patches will be created.
# If the pathes are not needed then uncomment the next exit command
#exit
# ICON prepare_gridref namelist
# Parameter overview:
# grid_root: Number of root bisections
# start_lev: Grid level of global domain
# n_dom:
            Total number of model domains (including the global one)
# parent_id: List of parent domain ID's (starts at first nested domain,
            which has ID=2)
#
           true = circular subdomains, false =
# l_circ:
            rectangular (lat/lon) subdomains
# l_rotate: true: rotate center point into equator in case of l_circ=false
           this yields truly rectangular subdomains, whereas subdomains
#
            are conical otherwise because of the convergence of meridians
# NOTE:
           For subdomains crossing a pole, either l_circ=true
            or l_rotate=true is required
# l_plot:
           true: Generates GMT files for domain configuration
# NOTE:
            The following parameters have to be specified for each nested
            domain!
# radius:
            radius (deg) of nested domains (for l_circ=true)
# center_lon: Center longitude of nested domains
# center_lon: Center latitude of nested domains
# hwidth_lon: half-width longitude of nested domains (for l_circ=false)
# hwidth_lat: half-width latitude of nested domains (for 1_circ=false)
#-----
# suffix of grid files which specifies optimization type
```

```
# (without optimization leave empty)
#OPTFIX=spr0.90_M4
# NOTE: _M4 means that maxlev_optim = 4 has to be set in the grid generator
# maxlev_optim is not needed for Heikes-Randall optimization
#----
# Create plots of domain configuration
PLOTS=.false.

1.8.2 Information contained in grid files

The ICON grids are treated as a general unstructured grid, so the grid NetCDF-files contain the full information of the location and the connectivity of all the grid entities (cells, edges and vertices). The grid nesting hierarchy information is also included.

Some basic variables that may be useful for plotting are:

```
double clon(cell)
                                : longitude of cell centers [radian]
                                : latitude of cell centers [radian]
double clat(cell)
double clon_vertices(cell, nv) : longitudes of the vertices of the cell [radian]
double clat_vertices(cell, nv) : latitudess of the vertices of the cell [radian]
double elon(edge)
                                : longitude of edge midpoint [radian]
double elat(edge)
                                : latitude of edge midpoint [radian]
double elon_vertices(edge, no)
                               : longitudes of the vertices of the edges [radian]
double elat_vertices(edge, no) : latitudes of the vertices of the edges [radian]
double vlon(vertex)
                                : longitude of vertices [radian]
double vlat(vertex)
                                : latitude of vertices [radian]
double cell_area(cell)
                                : area of grid cell [m2]
double cell_elevation(cell)
                               : elevation at the cell centers [m]
      cell_sea_land_mask(cell): sea (-2 inner, -1 boundary)
                                  land (2 inner, 1 boundary) mask for the cell
```

```
double edge_length(edge) : lengths of edges of triangular cells [m] double dual_edge_length(edge) : lengths of dual edges (distances between triangular cell circumcenters) [m] ...
```

For a full listing of variables contained in a grid file, for instance in iconR2B04-grid.nc, use:

```
ncdump -h iconR2B04-grid.nc
```

or

cdo sinfov iconR2B04-grid.nc

1.8.3 Viewing/plotting grids

In order to plot an icon grid you should ensure that ncl-6.0 and cdo-1.5.4 is available on your machine. Then go to the \$ICONDIR/grids/ folder and give:

```
alias iplot="ncl $ICONDIR/scripts/postprocessing/tools/icon_plot.ncl
'altLibDir="$ICONDIR/scripts/postprocessing/tools/"'" iplot 'iFile="<grid file name>"'
'mapType="ortho"' 'varName="cell_sea_land_mask"' 'oType="png"' 'showGrid=True'
'lStrg="Cell sea land mask"' 'bStrg=""'
```

The above example will plot cell sea land mask. More details on plotting can be found at the Visualization chapter.

The \$ICONDIR/run/post.plot_icon_grids script can be used to plot nested grids. Go to \$ICONDIR/run/ folder and give:

```
./post.plot_icon_grids
```

A PDF-file with a plot of the iconR2B04_DOM01 and iconR2B05_DOM02 grids will appear on your screen. (Note that this process is time consuming.)

Discussion

Document last edited by $B\ Vogel$ on 27-06-2014.

2 Output

In general the user has to specify six individual quantities to generate output of the model. These are:

- 1. The time interval between two model outputs.
- 2. The name of the output file.
- 3. The name of the variable.
- 4. The type of the vertical output grid (e.g. pressure levels or model levels).
- 5. The type of the horizontal output grid (e.g. ICON grid or geographical coordinates).

ICON offers the possibility to write groups of variables. In the following we will present two examples to demonstrate the options the user has to prescribe these quantities. A detailed description of all namelist parameters available to organize the output is described in io_nml in the namelist section.

Example 1

We will begin with an individual variable which is written in NETCDF format on pressure levels and is interpolated to a horizontally regular lat-long grid:

```
NAMELIST EXAMPLE
&io_nml
filetype
                                   ! output format: 2=GRIB2, 4=NETCDFv2
                                  ! write output for domain 1
dom
                           = 0., 1.E7, 3600. ! start, end, interval in s.
output_bounds
                                  ! max. num. of time steps within one file
steps_per_file
mode
                                  ! 1: forecast mode (relative t-axis)
include_last
                           = .TRUE. ! include the last time step
                           = '<INSERTFILENAME>' ! file name base
output_filename
pl_varlist
                           = 'geopot' ! name of pressure level field
                                 ! output is transferred to lat long grid
remap
reg_lon_def
                           = 0.,0.5,359.5
                                            !start, incr., end, in deg.
                           = 90.,-0.5, -90. !start, incr., end, in deg.
reg_lat_def
```

Example 2

The flexibility of the options ICON offers is demonstrated in another example. Now we apply an alternative to define the runtime of ICON, write several variables, at the same time, in

one data set, on model levels, and on the original horizontal grid of ICON. In addition the example below shows the options when several model domains run at the same time and we want to produce output for all model domains.

```
NAMELIST EXAMPLE
&output_nml
dom
                                 -1 ! write all domains
steps_per_file
                                 5 ! max. num. of time steps within
  output_start
                   = "1978-01-01T00:00:00Z" ! ISO-format date+time
                   = "1979-01-02T00:00:00Z" ! ISO-format date+time
  output_end
  output_interval
                   = "PT01H"
                                             ! ISO-format interval
  file_interval
                   = "PTO1D"
                                             ! ISO-format interval
  include_last
                   = .FALSE.
  output_filename
                               = '<INSERTFILENAME>'
                                                        ! file name base
 ml_varlist='u', 'group:precip_vars' ! Indiv. variable and variable group
                   = .TRUE. ! Output on the ICON horizontal grid
  output_grid
```

Variable groups

Next we explain the meaning of variable groups. Using the "group:" keyword for the namelist parameters ml_varlist, hl_varlist, pl_varlist, sets of common variables can be added to the output.

There exists a special syntax which allows to remove variables from the output list, e.g. if these undesired variables were contained in a previously selected group.

Typing "-<varname>" (for example "-temp") removes the variable from the union set of group variables and other selected variables. Note that typos are not detected but that the corresponding variable is simply not removed!

How to find variable names and contents of variable groups

Finding the correct names of the variables you may want to write to a data set is not an easy task and you should be aware of some pitfalls. We will help you to avoid the most obvious ones. First of all users that have already experience with the COSMO model should know that the names of the atmospheric variables in ICON are **not identical**.

The easiest way to identify the correct names of the variables you would like to write is to look into the following data sets:

```
atm_dyn_iconam/mo_nonhydro_state.f90
atm_phy_nwp/mo_nwp_phy_state.f90
lnd_phy_nwp/mo_nwp_lnd_state.f90
```

Now you may want to use the option of writing groups of variables and of course you may want to know which variable belongs to which group. Keep in mind that there is an option mentioned before to remove variables from the output of a group of variables.

The following table gives overview on the allocation of variables to individual variable groups.

If you want to translate the Fortran variables to the physical or mathematical ones again have a look to the Fortran files listed above.

Data format

ICON offers the possibility to produce output either in NETCDF or GRIB2 format. This can be chosen by the namelist parameter filetype of the namelist &output_nml. New users are suggested to set filetype=4 in order to use NETCDF output.

In GRIB2, a variable is uniquely defined by the following set of metadata:

- Discipline (see GRIB2 code table 4.2)
- ParameterCategory (see GRIB2 code table 4.2)
- ParameterNumber (see GRIB2 code table 4.2)
- typeOfFirstfixedSurface and typeOfSecondFixedSurface (see GRIB2 code table 4.5)
- step Type (instant, accum, avg, max, min, diff, rms, sd, cov, ...)

A documentation of the official WMO GRIB2 code tables can be found on the website of WMO:

 $http://www.wmo.int/pages/prog/www/WMOCodes/\\WMO306_vI2/LatestVERSION/WMO306_vI2_GRIB2_CodeFlag_en.pdf.$

Time stamp format

The namelist parameters output_start, output_end, output_interval allow the specification of time stamps according to ISO 8601. The general format for time stamps is YYYY-MM-DDThh:mm:ss where Y: year, M: month, D: day for dates, and hh: hour, mm: minute, ss: second for time strings. The general format for durations is PnYnMnDTnHnMnS. See, for example, http://en.wikipedia.org/wiki/ISO_8601 for details and further specifications.

NOTE: as the mtime library underlaying the output driver currently has some restrictions concerning the specification of durations:

- 1. Any number n in PnYnMnDTnHnMnS must have two digits. For instance use "PT06H" instead of "PT6H"
- 2. In a duration string PnyearYnmonMndayDTnhrHnminMnsecS the numbers nxyz must not pass the carry over number to the next larger time unit: 0<=nmon<=12, 0<=nhr<=23, 0<=nmin<=59, 0<=nsec<=59.999. For instance use "PT01D" instead of "PT24H", or "PT01M" instead of "PT60S".

Soon the formatting problem will be resolved and the valid number ranges will be enlarged. (2013-12-16).

Extra output

- 1. In the namelist run_ctl set the number of fields with inextra_2d or inextra_3d. The logical variable for output lwrite_extra then will be set automatically. Note, the number of extra fields is limited by 9 each for 2D and 3D.
- 2. USE these variables in the module needed.
- 3. Implement the storage of wished fields by using the nonhydrostatic diagnostic type with p_diag%extra_2d/3d.

Example for the use of p_diag%extra_2d:

```
USE mo_global_variables, ONLY: inextra_2d
...
DO jc = i_startidx, i_endidx
p_diag\%extra_2d(jc,jb,1)= yxz(jc,jb)
ENDDO
```

Asynchronous output:

It is highly recommended that the asynchronous output option of ICON is applied. In short this option reserves a number of processors for output only. While writing the remaining processors continuously carry out calculations. Otherwise they would have to wait until output is finished. The corresponding namelist parameter is:

```
&parallel_nml
num_io_procs = n
```

n is the number of processors used for output.

Time mean output:

The builtin functionality for getting time-averaged output fields preliminary is in an intermediate state. It has the following limitation:

- The list of variables for which time averages can be obtained is fixed. There is no way to change this via namelist
- Respective variables are collected into groups: prog_timemean, echam_timemean, tracer_timemean (all: atmo_timemean)
- When time-averaged output is selected, only a single output interval per model component is allowed for the whole experiment
- Output interval has to be a divisor of the restart interval, because the intermediate accumulation results are not saved
- The output for the initial timestep of the time mean variables is zero.

Testing Time mean: There are 3 tests prepared for checking the correctness all based on the amip setup: exp.atm_amip_acc_dtime, exp.atm_amip_acc_2dtime exp.atm_amip_acc_dtime_sp, which are all located in run/checksuite.icon-dev/timeMean. All of them have a runtime of 80 minutes with timestep dtime = 20min:

- exp.atm_amip_acc_dtime_sp: This test has output for time mean variables and their instantanious counterparts versions each time step. It uses the default single precision for output.
- exp.atm_amip_acc_dtime: Same as above, but with double precision output
- exp.atm_amip_acc_2dtime: Same as double precision, but with output every second timestep

To get binary identical data for online and offline computed mean values, double precision has to be used for output and for IO-related MPI communication. In order get the latter activated the variable use_dp_mpi2io from the parallel_nml has to be set to TRUE. The testing is splitted into 2 steps. The first should ensure, that the output of the instantanious variables is identical to the output if the same variables averaged over one timestep. This can be done with exp.atm_amip_acc_dtime_sp. The values of the variable pairs should be identical in the output file: The shell script exp.check_timemean_01 can be used for this

time mean	cosmu0_m	flxdwswtoa_m	aclcov_m	rsfl_m	rsfc_m	ssfl_m	$ssfc_m$	totprec_m	qvi_m	xlvi_m	xivi_m
instant	cosmu0	rsdt	clt	prlr	prcr	prls	prcs	$_{ m pr}$	prw	cllvi	clivi
time mean	swflxsfc_m	swflxtoa_m	lwflxsfc_m	lwflxtoa_m	tsfc_m	evap_m	lhflx_m	shflx_m	u_stress_m	v_stress_m	
instant	rsns	rsnt	rlns	rlnt	ts	evspsbl	hfls	hfss	tauu	tauv	
time mean	xlvi_m	xivi_m	$swflxsfc_m$	$swflxtoa_m$	$lwflxsfc_m$	lwflxtoa_m	$tsfc_m$	evap_m	lhflx_m	shflx_m	
instant	cllvi	clivi	rsns	rsnt	rlns	rlnt	ts	evspsbl	hfls	hfss	
time mean	qc_m	qv_m	qi_m								
instant	clw	hus	cli								
time mean	u_m	v_m	temp_m	pres_sfc_m	pres_msl_m	z_mc_m	rho_m				
instant	ua	va	ta	ps	psl	zg	rho				

purpose.

The second check compares online and offline computations. Therefor both exp.atm_amip_acc_dtime and exp.atm_amip_acc_2dtime has to be run. For all variables in the time mean group, the values of the exp.atm_amip_acc_2dtime experiment have to be equal to the mean values of the corresponding variables and timesteps in the results of exp.atm_amip_acc_dtime. For example the time mean of timesteps 2 and 3 from exp.atm_amip_acc_dtime should have no difference to timestep 2 of exp.atm_amip_acc_2dtime. exp.check_timemean_02 executes this check.

Example Usage For getting 6-hourly averaged output, two namelist variable of output_nml has to be set up:

- output_interval = "PTO6H"
- ml_varlist should contain the desired list of variables e.g. 'u_m', 'v_m', 'qv_m', 'rho_m', 'temp_m', 'xlvi_m', 'cosmuO_m' or 'group:prog_timemean', 'group:echam_timemean'

3 Visualization

Visualizing data on a non-regular grids is a task on its own, because the number of tools for solving such problem is very limited. NCL is one of them and we chose it as the main tool for ICON. You can find several examples of how to write simple plot scripts for ICON data sets on this website: http://www.ncl.ucar.edu/Applications/icon.shtml. The coordinate information is essential for writing your own plot scripts. ICON output files currently have three different types of them: cells, edges and vertices, e.g. tracers like temperature and salinity and surface elevation are defined on each cell center while the normal velocity is defined on edges.

3.1 icon_plot.ncl

For getting around the different coordinates and in order not to rewrite things there is a general plot scripts: icon_plot.ncl. It supports contour and vector plots, a combination of both via overlaying and vertical sections. Both atmosphere and ocean vertical coordinate systems can be handled by it: While ocean uses a plain depth axes, atmosphere model uses hybrid sigma pressure levels (hydrostatic) and free 3D height variable (non-hydrostatic).

The script icon_plot.ncl is a single NCL program, which provides multiple plot types for data on ICON's grid. It is located in the ICON-repository under source:/trunk/icon-dev/scripts/postprocessing/tools/icon_plot.ncl. Most of the functionality is implemented in a library: icon_plot_lib.ncl located in source:/trunk/icon-dev/scripts/postprocessing/tools/icon_plot_lib.ncl. Both files are installed into the /pool/data/ICON/tools which is the default lookup location for the library. For different location like an icon checkout, use altLibDir, e.g. altLibDir='"/home/user/src/icon-dev/tools"'.

3.1.1 Requirements

- NCL 5.2.1 is the minimum version of NCAR's plotting language (http://www.ncl.ucar.edu)
- CDO (https://code.zmaw.de/projects/cdo)

3.1.2 Customization

icon_plot.ncl optionally reads a configuration file named \$HOME/.icon_plot.rc where default options can be set. Actually it is handled like an ordinary ncl file. This can be used to customize the altLibDir setting, e.g.:

altLibDir="/home/ram/src/git/icon/scripts/postprocessing/tools"

```
oType="png"
```

3.1.3 Basic command line option

Required are options for

- 1. **Input/output files**: Use the variable iFile for defining the input and oFile for the output file. It's extension depends on the output type, which can be set with oType. If oFile is left out, the output file will inherit its name from the input file.
- 2. Variable selection: Depending on the plot mode you like to use, varName for scalar variables or vecVars for vector-variables must be uses.

Optional (default:0) parameter are

- 1. **Level selection**: Levels can only be selected by their index. That's why, the corresponding variables is called **levIndex**. Please note that it starts with 0, like any other NCL indices.
- 2. **Time selection**: Like levIndex, the variable **timeStep** can be used to select a certain time step, again starting from 0.

There are many more parameters (see 3.1.8) for mapping, transections, selecting regions and masking, but these are the most fundamental ones.

3.1.4 Plot Types

For flexibility the selection of a specific plot mode is implemented by combining certain options.

Contour plots

Contour plot are the default plot mode. If only the require parameters are set, e.g. iFile and varName, a simple contour plot is created with

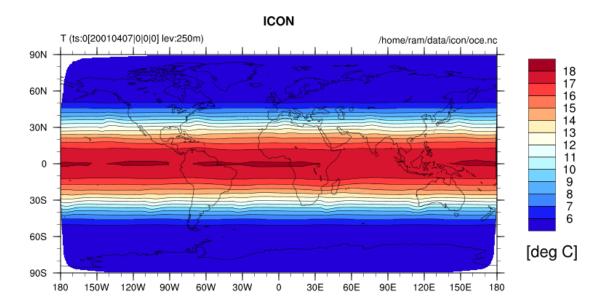

```
ncl icon_plot.ncl 'varName="T"' 'iFile="iFILENAME"'
```

This is a basic temperature plot. Captions are set to basic information like variable name, time and level information and input filename.

Vector plots

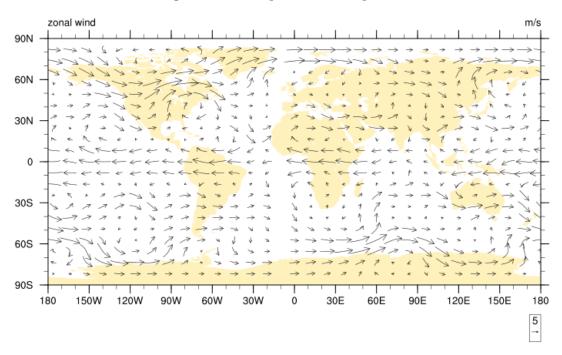

Use vecVars instead of varName. To adjust the length of the reference vector, use the variable vecRefLength.

```
ncl icon_plot.ncl 'vecVars="U V"' 'iFile="iFILENAME"' vecRefLength=0.01
```

Prgr icon_plot.ncl: Wed Nov 30 14:28:49 CET 2011,ram

Figure 3.1: Example of contour plot

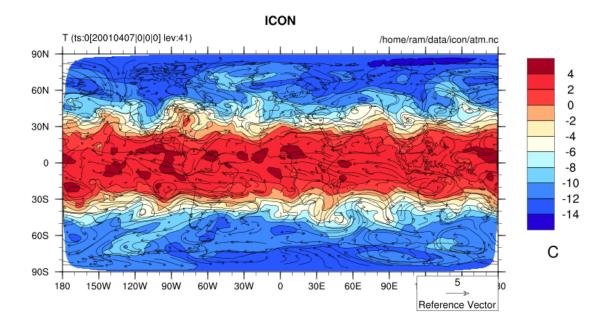

Prgr icon_plot.ncl: Wed Nov 30 14:39:10 CET 2011,ram

Figure 3.2: Example of vector plot

Overlay of scalar and vector variables

Contour and vector plots can be combined into a single plot by overlaying both. Following this approach, such an overlay plot will be created, if varName and vecVars are given:

ncl icon_plot.ncl 'varName="T"' 'iFile="iFILENAME"' 'vecVars="U V"'

Prgr icon_plot.ncl: Wed Nov 30 14:51:24 CET 2011,ram

Figure 3.3: Example of overlay plot

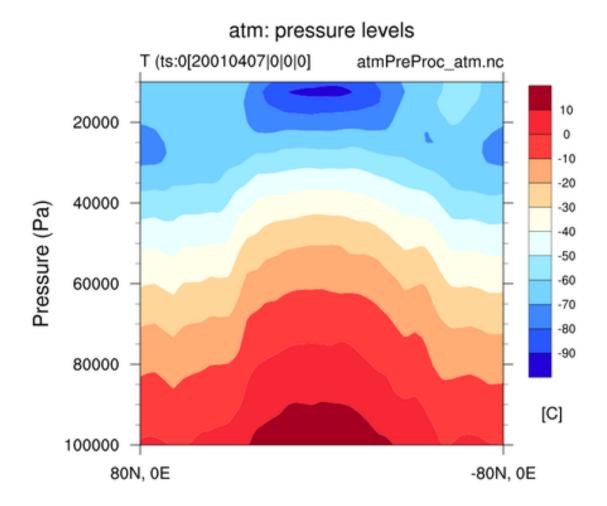

Vertical sections

Data for sections have to be interpolated first. This is done internally and you do not have to care about it. Section plot are created, if a start and and end point of a section is given. For this purpose, the variables secLC (section-left-corner) and secRC (section-right-corner) have to be used. Theses variable have to be (lon,lat) arrays like secLC=(/20.,30./).

Example call:

```
ncl icon_plot.ncl 'varName="T"' 'iFile="iFILENAME"' \
    'secLC=(/0,80/)' 'secRC=(/0,-80/)'
```

secPoints is an option to set the accuracy of the plot. The representing of the location of the section is suppressed by setting showSecMap=False. Its default value is True.

Prgr icon_plot.ncl: Wed Nov 30 15:05:50 CET 2011,ram

Figure 3.4: Example of vertical sections plot

Display the ICON grid

Set the parameter showGrid to True and for scalar variables, the ICON grid is represented instead of the contour plot. For large grids, this can take a long time.

3.1.5 Regional plots

Use the variables mapLLC (map-Lower-Left-Corner) and mapURC (map-Upper-Right-Corner) to select special regions of the earth. Here is a list of useful examples:

Table 3.1: Examples of useful regional plots

Trop. Atlantic	'mapLLC=(/-60, -25/)'	'mapURC=(/ 25,25/)'
North Polar	'mapLLC=(/-200, 20/)'	'mapURC=(/160,90/)'
North Atlantic	'mapLLC=(/-100,-15/)'	'mapURC=(/ 35,65/)'
Labrador/Panama	'mapLLC=(/-200, -5/)'	'mapURC=(/ 35,85/)'
North Atlantic/Eurasia	'mapLLC=(/ -80, -5/)'	'mapURC=(/ 75,85/)'
Asia	'mapLLC=(/ 20,-15/)'	'mapURC=(/160,85/)'

3.1.6 Masking

Masking can be done in two different ways:

1. Manually mask the data with CDO before running the plot scripts, i.e. use the ifthen operator or perform a division with the mask variable:

```
cdo div iconInput.nc -selname,mask_variable iconInput.nc maskedOutput.nc
```

2. Let the plot script perform the masking using the NCL's mask function. For this purpose, the commandline variables maskName and maskFile have to be used. If the mask variable is part of the regular input file, maskFile can be left out.

Both methods have their pros and cons. Whereas the second methods works fine for all types of horizontal representation, the first produces better results for vertical cross sections.

3.1.7 Data on other grids

Although icon_plot.ncl is implemented for ICON, it can be used for data an regular grids, too. In this case, internal interpolation is not performed.

3.1.8 All options

icon_plot.ncl has built-in documentation of all options. Use

ncl icon_plot.ncl help=True

3.2 ncview/GrADS

Neview (http://meteora.ucsd.edu/~pierce/neview_home_page.html) and GrADS (http://www.iges.org/grads/) can be used after converting icon data sets to a regular grid. This can easily be done with edo:

```
cdo -P 8 -r remapnn,r180x90 icon.nc regular_icon.nc
```

This uses nearest neighbor interpolation and hereby keeps the model values. When using a higher regular resolution the triangular icon grid keeps visible.

3.3 Other Possibilities

- $\bullet\,$ GMT is useful, when the grid should be visualized.
- ParaView is an alternative to display data on an unstructured grid. As a caveat, the model output has first to be converted into the vtk format.

Discussion

Document last edited by $I.\ Kraut$ on 29.11.2013. Note: -

4 ICON Namelists Overview

4.1 Namelist Annotation

Every ICON run generates annotated lists of namelist parameters during the setup. These lists are written to text files nml.atmo.log, nml.cpl.log, nml.ocean.log and have the following form:

```
NAMELIST IO_NML

OUT_EXPNAME 'case4 [...]' (truncated)

>> DEFAULT: 'IIIEEETTTT [...]' (truncated)

OUT_FILETYPE 2

LKEEP_IN_SYNC F

DT_DATA 43200.0000000000000000

DT_DIAG 1728000.00000000000

>> DEFAULT: 21600.00000000000

>> DEFAULT: 86400.000000000000
```

and so on.

The DEFAULT annotation denotes all those parameters that have been modified by the user; in this case the default value of the namelist parameter is stated together with the modified value. All other namelist parameters are listed only with their default values.

4.2. ICON NAMELISTS 51

4.2 ICON Namelists

4.2.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the grid generation and the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in < icon home>/build/<architecture>/bin/.

Table 4.1: Namelist files

Namelist file	Purpose	Made by script	Used by program
NAMELIST_GRAPH	Generate graphs	create_global_grids.run	grid_command
$NAMELIST_GRID$	Generate grids	create_global_grids.run	grid_command
NAMELIST_GRIDREF	Gen. nested domains	create_global_grids.run	grid_command
NAMELISTICON	Run ICON models	exp.jname¿.run	control_model

4.2.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- Type refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- Default is the preset value, if defined, that is assigned to this parameter within the programs.
- Unit shows the unit of the control parameter, where applicable.
- Description explains in a few words the purpose of the parameter.
- Scope explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

4.3 Namelist parameters for grid generation

4.3.1 Namelist parameters defining the atmosphere grid

graph_ini (NAMELIST_GRAPH)

Parameter	Type	Default	Unit	fault Unit Description	Scope
nroot	I	2		root subdivision of initial edges	
grid -levels	I	4		number of edge bisections following the root	
				subdivision	
lplane	П	FALSE.		switch for generating a double periodic planar	
				grid. The root level consists of 8 triangles.	

Defined and used in: src/grid_generator/mo_io_graph.f90

grid_ini (NAMELIST_GRID)

Parameter	Type	Default	Unit	Default Unit Description	Scope
nroot	I	2		root subdivision of initial edges	
$\operatorname{grid_levels}$	Ι	4		number of edge bisections following the root	
				subdivision	
lplane	П	.FALSE.		switch for generating planar grid. The root	
				level consists of 8 triangles.	

Defined and used in: src/grid_generator/mo_grid_levels.f90

grid_options (NAMELIST_GRID)

Parameter	Type	Default	Unit	Unit Description	Scope
x_rot_angle	\mathbf{R}	0.0	deg	Rotation of the icosahedron about the x-axis	
				(connecting the origin and $[0^{\circ}E, 0^{\circ}N]$)	
y_rot_angle	R	0.0	deg	Rotation of the icosahedron about the y-axis	
				(connecting the origin and $[90^{\circ}\text{E}, 0^{\circ}\text{N})$, done	
				after the rotation about the x-axis.	
z_rot_angle	R	0.0	deg	rotation of the icosahedron about the z-axis	
				(connecting the origin and $[0^{\circ}E, 90^{\circ}N)$, done	
				after the rotation about the y-axis.	
itype_optimize	I	4		Grid optimization type	
				0: no optimization	
				1: Heikes Randall	
				2: equal area	
				3: c-grid small circle	
				4: spring dynamics	
l_c_grid	IJ	FALSE.		C-grid constraint on last level	

Parameter	Type	Default	Unit	Description	Scope
maxlev_optim	I	100		Maximum grid level where the optimization is	$i_{\text{-type-optimize}} = 1 \text{ or}$
				applied	4
beta_spring	$_{ m R}$	06.0		tuning factor for target grid length	$i_{type_optimize} = 4$

Defined and used in: src/grid_generator/mo_grid_levels.f90

plane_options (NAMELIST_GRID)

Parameter	Type	Default	Unit	Description	Scope
tria_arc_km	m R	10.0	km	length of triangle edge on plane	lplane=.TRUE.

The number of grid points is generated by root level section and further bisections. The double periodic root level consists of 8 triangles. The spatial coordinates are $-1 \le x \le 1$, and $-\sqrt{3}/2 \le y \le \sqrt{3}/2$. Currently the planar option can only be used as an f-plane.

Defined and used in: src/grid_generator/mo_grid_levels.f90

gridref_ini (NAMELIST_GRIDREF)

Parameter	Type	Default	Unit	fault Unit Description Sc	Scope	
grid_root	I	2		root subdivision of initial edges		
start_lev	I	4		number of edge bisections following the root		
				subdivision		
mop-u	I	2		number of logical model domains, including the		
				global one		
$ m n_phys_dom$	I	n_dom		number of physical model domains, may be		
				larger than n_dom (in this case, domain		
				merging is applied)		

Parameter	Type	Default	Unit	Description Score	Scope
parent_id	I(n-phys-			ID of parent domain (first entry refers to first	
	dom-1			nested domain; needs to be specified only in	
				case of more than one nested domain per grid	
,	·			level)	
logical_id	I(n-phys-	i+1		logical grid ID of domain (first entry refers to	
	dom-1			first nested domain; needs to be specified only	
				in case of domain merging, i.e. n_dom <	
				n-phys-dom)	
l_plot	J	FALSE.		produces GMT plots showing the locations of	
				the nested domains	
l_circ	L	.FALSE.		Create circular (.T.) or rectangular (.F.)	
				refined domains	
l_rotate	J	.FALSE.		oint into the equator in case of	lcirc=.FALSE.
				1-circ = .FALSE.	
write_hierarchy	I	1		0: Output only computational grids	
				1: Output in addition parent grid of global	
				model domain (required for computing physics	
				on a reduced grid)	
				2: Output all grids back to level 0 (required for	
				hierarchical search algorithms)	
lsep_gridref_info	J	.FALSE.		.TRUE.: write fields describing parent-child	
				connectivities into separate grid files	
uuid_sourcefile	C(n-dom)	$C(n_{-dom})$ 'EMPTY'		If specified, provides the names of existing grid	
				files from which the unid shall be copied. If a	
				radiation grid is present, the first entry refers	
				to this grid.	
${ m bdy_indexing_depth}$	Ι	12		Number of cell rows along the lateral boundary	
				of a model domain for which the refin_ctrl fields	
				contain the distance from the lateral boundary;	
				needs to be enlarged when lateral boundary	
_				nudging is required for one-way nesting	_

Parameter	Type	Default Unit	Unit	Description	Scope
radius	R(n_dom-	30.	deg	radius of nested domain (first entry refers to	lcirc=.TRUE.
	1)			first nested domain; needs to be specified for	
				each nested domain separately)	
hwidth lon	R(n_dom-	20.	deg	zonal half-width of refined domain (first entry	lcirc=.FALSE.
	1)			refers to first nested domain; needs to be	
				specified for each nested domain separately)	
hwidth_lat	R(n_dom-	20.	deg	meridional half-width of refined domain (first	lcirc=.FALSE.
	1)			entry refers to first nested domain; needs to be	
				specified for each nested domain separately)	
center_lon	R(n_dom-	30.	deg	center longitude of refined domain (first entry	
	1)			refers to first nested domain; needs to be	
				specified for each nested domain separately)	
center_lat	R(n_dom-	.06	deg	center latitude of refined domain (first entry	
	1)			refers to first nested domain; needs to be	
				specified for each nested domain separately)	

Defined and used in: ${\tt src/grid_generator/mo_gridrefinement.f90}$

gridref_metadata (NAMELIST_GRIDREF)

Parameter	Type	Default	Unit	Default Unit Description Scope	ope
number_of_grid_used	+mop-u)I	0		sets the number of grid used in the netcdf	
	1)			header; the number of entries must be	
				n_dom+1 since the first number refers to the	
				radiation grid	
centre	I	0		centre running the grid generator	
				78: EDZW (DWD)	
				252: MPIM	
subcentre	I	0		subcentre to be assigned by centre, usually 0	

Parameter outname_style	Type I	Default 1	Unit	Description Output name style 1: Standard: iconRXBXX_DOMXX.nc	Scope
				2: DWD: icon_grid_XXXX_RXXBXX_X.nc	

Defined and used in: src/grid_generator/mo_gridrefinement.f90

4.3.2 coupling_mode_nml

Delaute Onle		2 000
	Cocriboton	prope
FALSE.	TRUE:: if yac coupling routines have to be	
	called	
		called

Defined and used in: src/namelists/mo_coupling_nml.f90

4.4 Namelist parameters defining the atmospheric model

Namelist parameters for the ICON models are organized in several thematic Fortran namelists controling the experiment, and the properties of dynamics, transport, physics etc.

4.4.1 diffusion_nml

Parameter	Type	Default	Unit	Description	Scope
lhdiff_temp	Γ	.TRUE.		Diffusion on the temperature field	
lhdiff_vn	Γ	.TRUE.		Diffusion on the horizontal wind field	
lhdiff_w	IJ	.TRUE.		Diffusion on the vertical wind field	

Parameter	Type	Default	Unit	Description	Scope
hdiff_order	I	4 (hy-		Order of ∇ operator for diffusion:	Options 2, 24 and 42
		dro)		-1: no diffusion	are allowed only in the
		5 (NH)		2: ∇^2 diffusion	hydrostatic atm model
				3: Smagorinsky ∇^2 diffusion	(iequations = $1 \text{ or } 2 \text{ in}$
				4: ∇^4 diffusion	dynamics_nml).
				5: Smagorinsky ∇^2 diffusion combined with ∇^4	
				background diffusion as specified via	
				hdiff_efdt_ratio	
				24 or 42: ∇ 2 diffusion from model top to a	
				certain level (cf. k2-pres-max and k2-klev-max	
				below); ∇^4 for the lower levels.	
lsmag-3d	L	FALSE.		.TRUE.: Use 3D Smagorinsky formulation for	hdiff_order=3 or 5;
				computing the horizontal diffusion coefficient	itype_vn_diffu=1
				(recommended at mesh sizes finer than 1 km if	
				the LES turbulence scheme is not used)	
itype_vn_diffu	I	1		Reconstruction method used for Smagorinsky	iequations=3,
				diffusion:	hdiff_order=3 or 5
				1: u/v reconstruction at vertices only	
				2: u/v reconstruction at cells and vertices	
itype_t_diffu	I	2		Discretization of temperature diffusion:	iequations=3,
				$1: K_h \nabla^2 T$	hdiff_order=3 or 5
				$2: \nabla \cdot (K_h \nabla T)$	
k2_pres_max	$_{ m R}$	-99.	Pa	Pressure level above which ∇^2 diffusion is	$hdiff_{order} = 24 \text{ or } 42,$
				applied.	and dynam-
					$ics_nml:iequations = 1$
					or 2.
k2_klev_max	I	0		Index of the vertical level till which (from the	hdiff_order = 24 or 42 ,
				model top) ∇^2 diffusion is applied. If a positive	and dynam-
				value is specified for k2_pres_max, k2_klev_max	ics_nml:iequations = 1
				is reset accordingly during the initialization of	or 2.
				a model run.	

Parameter	Type	Default	Unit	Description	Scope
hdiff_efdt_ratio	$_{ m R}$	1.0		ratio of e-folding time to time step (or 2* time	
		(hydro)		step when using a 3 time level time stepping	
		36.0		scheme) (for triangular NH model, values above	
		(NH)		30 are recommended when using hdiff_order=5)	
hdiff_w_efdt_ratio	R	15.0		ratio of e-folding time to time step for diffusion	iequations=3
				on vertical wind speed	
hdiff_min_efdt_ratio	R	1.0		minimum value of hdiff_efdt_ratio near model	iequations=3.AND.
				top	hdiff_order=4
hdiff_tv_ratio	\mathbb{R}	1.0		Ratio of diffusion coefficients for temperature	
				and normal wind: $T:v_n$	
hdiff_multfac	$_{ m R}$	1.0		Multiplication factor of normalized diffusion	n_dom>1
				coefficient for nested domains	
hdiff_smag_fac	R	0.15		Scaling factor for Smagorinsky diffusion	iequations=3
		(hydro)			
		0.015			
		(NH)			

Defined and used in: src/namelists/mo_diffusion_nml.f90

4.4.2 dynamics_nml

This namelist is relevant if run_nml:ldynamics=.TRUE.

Parameter	Type	Default	Unit	efault Unit Description	Scope	
iequations	I	3		Equations and prognostic variables. Use		
				positive indices for the atmosphere and		
				negative indices for the ocean.		
				0: shallow water model		
				1: hydrostatic atmosphere, T		
				2: hydrostatic atm., θ -dp		

Parameter	Type	Default	Unit	Description	Scope
				3: non-hydrostatic atmosphere	
				-1: hydrostatic ocean	
idiv_method	П	1		Method for divergence computation:	
				1: Standard Gaussian integral.	
				Hydrostatic atm. model: for unaveraged normal	
				components	
				Non-hydrostatic atm. model: for averaged	
				normal components	
				2: bilinear averaging of divergence	
divavg-cntrwgt	R	0.5		Weight of central cell for divergence averaging	$idiv_method = 2$
lcoriolis	П	TRUE.		Coriolis force	
sw_ref_height	R	*6.0	m	Reference height of shallow water model used	
		2.94e4/g		for linearization in the semi-implicit time	
				stepping scheme	

Defined and used in: src/namelists/mo_dynamics_nml.f90

4.4.3 echam_conv_nml

Parameter	Type	$\mathbf{Default}$	Unit	Default Unit Description	Scope
conv	I	1		Choice of cumulus convection scheme.	iforcing $= 2$.AND.
				1: Nordeng scheme	lconv = .TRUE.
				2: Tiedtke scheme	
				3: hybrid scheme	
ıcvmicro	I	0		Choice of convective microphysics scheme.	iforcing = 2 .AND.
					lconv = .TRUE.
mfpen	Г	.TRUE.		Switch on penetrative convection.	iforcing = 2 .AND.
					lconv = .TRUE.
mfmid	ı	.TRUE.		Switch on midlevel convection.	iforcing $= 2$.AND.
					lconv = .TRUE.

Parameter	Type	Default	Unit	Description	Scope
lmfdd	J	TRUE.		Switch on cumulus downdraft.	iforcing $= 2$.AND.
					lconv = .TRUE.
lmfdudv	Г	TRUE.		Switch on cumulus friction.	iforcing $= 2$.AND.
					lconv = .TRUE.
cmftau	R	10800.		Characteristic convective adjustment time	iforcing $= 2$.AND.
				scale.	lconv = .TRUE.
cmfctop	R	0.3		Fractional convective mass flux (valid range	iforcing $= 2$.AND.
				[0,1]) across the top of cloud	lconv = .TRUE.
cprcon	\mathbf{R}	1.0e-4		Coefficient for determining conversion from	iforcing $= 2$.AND.
				cloud water to rain.	lconv = .TRUE.
cminbuoy	R	0.025		Minimum excess buoyancy.	iforcing $= 2$.AND.
					lconv = .TRUE.
entrpen	R	1.0e-4		Entrainment rate for penetrative convection.	iforcing $= 2$.AND.
					lconv = .TRUE.
dlev	R	3.e4	Pa	Critical thickness necessary for the onset of	iforcing $= 2$.AND.
				convective precipitation.	lconv = .TRUE.

Defined and used in: src/namelists/mo_echam_conv_nml.f90

4.4.4 echam_phy_nml

Parameter	Type	Default Unit	Unit	Description	Scope
lrad	T	.TRUE.		.TRUE. for radiation.	$run_nml/iforcing = 2$
dt_rad	R	3600.	w	time interval for radiative transfer computation	$run_nml/iforcing = 2$
lvdiff	Г	TRUE.		.TRUE. for vertical turbulent diffusion	$run_nml/iforcing = 2$
lconv	П	TRUE.		TRUE. for cumulus convection	$run_nml/iforcing = 2$
lcond	П	TRUE.		.TRUE. for large scale condensation	$run_nml/iforcing = 2$
lgw_hines	П	TRUE.		.TRUE. for non-orographic gravity wave drag	$run_nml/iforcing = 2$
				(Hines)	
lssodrag	Г	TRUE.		.TRUE. for subgrid scale orographic effects	$run_nml/iforcing = 2$
				(Lott and Miller)	
lice	П	FALSE.		.TRUE. for sea-ice temperature calculation	$run_nml/iforcing = 2$
lmlo	Г	.FALSE.		TRUE. for mixed layer ocean	$run_nml/iforcing = 2$
ljsbach	Г	.FALSE.		TRUE. for calculating land surface properties	$run_nml/iforcing = 2$
				(JSBACH)	
lamip	Г	FALSE.		TRUE. for AMIP boundary conditions	$run_nml/iforcing = 2$

Defined and used in: src/namelists/mo_echam_phy_nml.f90

4.4.5 ensemble_pert_nml

Parameter	Type	Default	Unit	efault Unit Description	Scope
use_ensemble_pert	Γ	.FALSE.		Main switch to activate physics parameter	run_nml:iforcing =
				perturbations for ensemble forecasts /	inwp
				ensemble data assimilation; the perturbations	
				are applied via random numbers depending on	
				the perturbationNumber (ensemble member	
				ID) specified in gribout_nml	

Parameter	Type	Default	Unit	Description	Scope
range-gkwake	R	0.1666		Variability range for low level wake drag	
				constant	
range-gkdrag	m R	0.02		Variability range for orographic gravity wave	
				drag constant	
range-gfluxlaun	m R	0.50e-3		Variability range for non-orographic gravity	
				wave launch momentum flux	
range_zvz0i	R	0.125	s/m	Variability range for terminal fall velocity of ice	inwp_gscp = 1 or 2
range_entrorg	R	0.125e-3	$1/\mathrm{m}$	Variability range for entrainment parameter in	$inwp_convection = 1$
				convection scheme	
range_capdcfac_et	R	0.1		Maximum fraction of CAPE diurnal cycle	icapdcycl = 3
				correction applied in the extratropics	
range_rhebc	R	0.05		Variability range for RH threshold for the	$inwp_convection = 1$
				onset of evaporation below cloud base	
${ m range_texc}$	m R	0.025	K	Variability range for temperature excess value	$inwp_convection = 1$
				in test parcel ascent	
range-box_liq	m R	0.01		Variability range for box width scale of liquid	$inwp_cldcover = 1$
				clouds in cloud cover scheme	
range_tkhmin	m R	0.15		Variability range for minimum vertical	$inwp_turb = 1$
				diffusion for heat/moisture	
range_tkmmin	m R	0.15		Variability range for minimum vertical	$inwp_turb = 1$
				diffusion for momentum	
range_rlam_heat	m R	1.5		Variability range (multiplicative!) of laminar	$inwp_turb = 1$
				transport resistance parameter	
range_minsnowfrac	\mathbb{R}	0.05		Variability range for minimum value to which	idiag_snowfrac =
				snow cover fraction is artificially reduced in	20/30/40
				case of melting snow	

Defined and used in: src/namelists/mo_ensemble_pert_nml.f90

4.4.6 gribout_nml

Parameter	Type	Default	Unit	Description	Scope
preset	C	"determ	× .	Setting this different to "none" enables a	filetype=2
				couple of defaults for the other gribout_nml	
				namelist parameters. If, additionally, the user	
				tries to set any of these other parameters to a	
				conflicting value, an error message is thrown.	
				Possible values are "none", "deterministic",	
				"ensemble".	
backgroundProcess	Ι	0		Background process	filetype=2
				- GRIB2 code table backgroundProcess.table	
generatingCenter	Ι	-1		Output generating center. If this key is not set,	filetype=2

				the internal ICON name, separated by an	
				arbitrary number of blanks. The line may also	
				start and end with an arbitrary number of	
				blanks. Empty lines or lines starting with #	
				are treated as comments.	
				Names not covered by the mapping are used as	
				they are.	

Parameter	Type	Default	Unit	Description	Scope
netcdf_dict	C	, ,		File containing the mapping from internal	output_nml namelists,
				names to names written to NetCDF. May	NetCDF output
				contain the keyword <pre><pre>contain the keyword <pre><pre>contain</pre></pre></pre></pre>	
				substituted by model_base_dir.	
				The format of this file:	
				One mapping per line, first the name written	
				to NetCDF, then the internal name, separated	
				by an arbitrary number of blanks (inverse to	
				the definition of output_nml_dict). The line	
				may also start and end with an arbitrary	
				number of blanks. Empty lines or lines starting	
				with # are treated as comments.	
				Names not covered by the mapping are output	
				as they are.	
				Note that the specification of output variables,	
				e.g. in ml_varlist, is independent from this	
				renaming, see the namelist parameter	
				output_nml_dict for this.	
lnetcdf_flt64_output	L	FALSE.		If .TRUE. floating point variable output in	
				NetCDF files is written in 64-bit instead of	
				32-bit accuracy.	
				This is currently implemented for the atm.	
				dynamical core and ECHAM physics.	
restart_file_type	I	4		Type of restart file. One of CDI's	
				FILETYPE_XXX. So far, only 4	
				(=FILETYPE_NC2) is allowed	
				(=ripriire/) is allowed	

Defined and used in: src/namelists/mo_io_nml.f90

4.4.14 les_nml (parameters for LES turbulence scheme; valid for inwp_turb=5)

Parameter	Type	Default	Unit	Description	Scope
sst	R	300	K	sea surface temperature for idealized LES	isrfc_type=5,4
				simulations	
shffx	$_{ m R}$	0.1	$\mathrm{Km/s}$	Kinematic sensible heat flux at surface	$isrfc_type = 2$
lhflx	R	0	s/m	Kinematic latent heat flux at surface	$isrfc_{-}type = 2$
srfc_type	I	1		surface type	
				0 = No fluxes and zero shear stress	
				1 = TERRA land physics	
				2 = fixed surface fluxes	
				3 = fixed buoyancy fluxes	
				4 = RICO test case	
				5 = fixed SST	
ufric	R	-999	s/m	friction velocity for idealized LES simulations;	
				if; 0 then it is automatically diagnosed	
psfc	R	666-	Pa	surface pressure for idealized LES simulations;	
				if; 0 then it uses the surface pressure from	
				dynamics	
min_sfc_wind	R	1.0	s/m	Minimum surface wind for surface layer useful	
				in the limit of free convection	
is_dry_cbl	ı	FALSE.		switch for dry convective boundary layer	
				simulations	
smag_constant	R	0.23		Smagorinsky constant	
km_min	R	0.0		Minimum turbulent viscosity	
max_turb_scale	R	300.0		Asymtotic maximum turblence length scale	
				(useful for coarse grid LES and when grid is	
				vertically stretched)	
turb_prandtl	R	0.333333		turbulent Prandtl number	
pflux	R	0.0007	$\mathrm{m}^2/\mathrm{s}^3$	buoyancy flux for idealized LES simulations	isrfc_type=3
				(Stevens 2007)	

Parameter	Type	Default	Unit	Description Sc	Scope
tran_coeff	R	0.02	s/m	transfer coefficient near surface for idealized isr LES simulation (Stevens 2007)	isrfc_type=3
vert_scheme_type	Ι	2		type of time integration scheme in vertical diffusion $1 = \text{explicit}$ $2 = \text{fully implicit}$	
sampl_freq_sec	R	09	SQ.	sampling frequency in seconds for statistical (1D and 0D) output	
avg_interval_sec	R	006	∞	(time) averaging interval in seconds for 1D statistical output	
expname	C	ICOLES		expname to name the statistical output file	
ldiag_les_out	Г	FALSE.		Control for the statistical output in LES mode	
les_metric	П	.FALSE.		Switch to turn on Smagorinsky diffusion with	
				3D metric terms to account for topography	

Defined and used in: src/namelists/mo_les_nml.f90

4.4.15 limarea_nml (Scope: I_limited_area=1 in grid_nml)

Parameter	Type	Default Unit		Description	Scope
itype_latbc	Ι	0		Type of lateral boundary nudging. Nudge from	
				0: the initial data,	
				1: IFS data analysis/forecast (if	
				initicon_nml:init_mode=4, we take	
				COSMO-DE data),	
				2: ICON output data (with the identical 3d	
				grid)	
dtime_latbc	\mathbf{R}	10800.0	w	Time difference between two consecutive	itype_latbc ≥ 1
				boundary data.	

Parameter	Type	Default Unit	Unit	Description	Scope
dt_latbc	C	PT03H		Time difference between two consecutive	itype_latbc ≥ 1
				boundary data in mtime format.	
$ootnotesize nlev_latbc$	Ι	0	∞	Number of vertical levels in boundary data.	itype_latbc ≥ 1
$latbc_filename$	C			Filename of boundary data input file, default:	itype_latbc ≥ 1
				"prepiconR <nroot>B<jlev>_<y><m><d><h>nc"</h></d></m></y></jlev></nroot>	
				<y>, <m>, <d>, and <h> will be automatically</h></d></m></y>	
				replaced during the run-time. In case the time	
				span between two consecutive boundary data is	
				less than 1 hour, one can use <min> and <sec>.</sec></min>	
				These files must be located in the latbc_path	
				directory.	
latbc_path	C			Absolute path to boundary data.	itype_latbc ≥ 1

Defined and used in: src/namelists/mo_limarea_nml.f90

4.4.16 Ind_nml

Parameter	Type	Default	Unit	Description	Scope
nlev_snow	I	2		number of snow layers	lmulti_snow=.true.
ntiles	I	1		number of tiles	
lsnowtile	П	FALSE.		.TRUE.: consider snow-covered and snow-free	ntiles>1
				tiles separately	
frlnd_thrhld	R	0.05		fraction threshold for creating a land grid point ntiles>1	ntiles>1
frlake_thrhld	\mathbf{R}	0.05		fraction threshold for creating a lake grid point	ntiles>1
frsea_thrhld	$_{ m R}$	0.05		fraction threshold for creating a sea grid point	ntiles>1
frlndtile_thrhld	$_{ m R}$	0.05		fraction threshold for retaining the respective	ntiles>1
				tile for a grid point	
lmelt	Γ	TRUE.		TRUE. soil model with melting process.	
lmelt_var	J	TRUE.		.TRUE. freezing temperature dependent on	
				water content	

Parameter	Type	Default	Unit	Description	Scope
lana_rho_snow	L	.TRUE.		TRUE. take rho_snow-values from analysis file	init_mode=1
lmulti_snow	Γ	TRUE.		TRUE. for use of multi-layer snow model	
max_toplaydepth	R	0.25	m	maximum depth of uppermost snow layer	lmulti_snow=.TRUE.
idiag_snowfrac	I	1		Type of snow-fraction diagnosis:	
				1 = based on SWE only	
				2-4 = more advanced experimental methods	
				20, 30, 40 = same as 2, 3, 4, respectively, but	
				with artificial reduction of snow fraction in	
				case of melting snow	
itype_Indtbl	I			Table values used for associating surface	
				parameters to land-cover classes:	
				1 = defaults from extpar (GLC2000 and	
				GLOBCOVER2009)	
				2 = Tuned version based on IFS values for	
				globcover classes (GLOBCOVER2009 only)	
				3 = even more tuned version	
				(EXPERIMENTAL!!, GLOBCOVER2009	
				only)	
itype_root	I	2		root density distribution:	
				1 = constant	
				2 = exponential	
itype_evsl	I	2		type of bare soil evaporation parameterization	
				2 = Dickinson (1984)	
				3 = Noilhan and Platon (1989)	
itype_heatcond	I	2		type of soil heat conductivity	
				1 = constant soil heat conductivity	
				2 = moisture dependent soil heat conductivity	

Parameter	Type	Default	Unit	Description	Scope
itype_interception	I	П		type of plant interception	
				1 = effectively switched off (secirity minimum	
				of $1E - 6$ m for surface area index)	
				2 = Rain and snow interception (under	
				development)	
itype_hydbound	Ι	1		type of hydraulic lower boundary condition	
				1 = none	
				3 = ground water as lower boundary of soil	
				column	
Istomata	П	TRUE.		If .TRUE., use map of minimum stomatal	
				resistance	
				If .FALSE., use constant value of 150 s/m.	
12tls	П	TRUE.		If .TRUE., forecast with 2-Time-Level	
				integration scheme	
seaice	Γ	TRUE.		TRUE. for use of sea-ice model	
llake	П	TRUE.		TRUE. for use of lake model	
sstice_mode	I	1		1: SST and sea ice fraction are read from the	iequations=3
				analysis and kept constant. The sea ice fraction	iforcing=3
				can be modified by the seaice model.	
				2: SST and sea ice fraction are updated daily,	
				based on climatological monthly means	
				3: SST and sea ice fraction are updated daily,	
				based on actual monthly means	
				4: SST and sea ice fraction are updated daily,	
				based on actual daily means, not yet	
				implemented	
sst_td_filename	C			Filename of SST input files for time dependent	sstice_mode=2,3
				SST. Default is	
				" <pre>"<path>SST_<year>_imonth_i.<gridfile>".</gridfile></year></path></pre>	
				May contain the keyword <pre></pre>	
		_		be substituted by model_base_dir	

Scope	$sstice_mode=2,3$				
Default Unit Description	Filename of sea ice fraction input files for time sstice_mode=2,3	dependent sea ice fraction. Default is	" <path>CI_<year>_<month>_<gridfile>".</gridfile></month></year></path>	May contain the keyword <path> which will</path>	be substituted by model_base_dir
Unit					
Default					
Type	О				
Parameter	ci_td_filename				

Defined and used in: src/namelists/mo_lnd_nwp_nml.f90

4.4.17 Is_forcing_nml (parameters for large-scale forcing; valid for torus geometry)

Parameter	Type	Default	Unit	Default Unit Description	Scope
is_subsidence_moment	Г	.FALSE.		switch for enabling LS vertical advection due	is_plane_torus=.TRUE.
				to subsidence for momentum equations	
is_subsidence_heat	ı	FALSE.		switch for enabling LS vertical advection due	is_plane_torus=.TRUE.
				to subsidence for thermal equations	
is_advection	T	FALSE.		switch for enabling LS horizontal advection	is_plane_torus=.TRUE.
				(currently only for thermal equations)	
is_geowind	Г	FALSE.		switch for enabling geostrophic wind	is_plane_torus=.TRUE.
is_rad_forcing	Γ	FALSE.		switch for enabling radiative forcing	is_plane_torus=.TRUE.
					inwp_rad=.FALSE.
is_theta	ı	.FALSE.		switch to indicate that the prescribed radiative	is_plane_torus=.TRUE.
				forcing is for potential temperature	is_rad_forcing=.TRUE.

Defined and used in: src/namelists/mo_ls_forcing_nml.f90

4.4.18 master_model_nml (repeated for each model)

Parameter	Type	Default	Unit	Description	Scope
model_name	C			Character string for naming this component.	
model_namelist_	C			File name containing the model namelists.	
filename					
$model_type$	I	-1		Identifies which component to run.	
				1=atmosphere	
				2=ocean	
				3=radiation	
				99=dummy_model	
model_min_rank	I	0		Start MPI rank for this model.	
model_max_rank	I	-1		End MPI rank for this model.	
model_inc_rank	I	П		Stride of MPI ranks.	

4.4.19 master_nml

Parameter	Type	Default	Unit	Default Unit Description	Scope
lrestart	L	FALSE.		If .TRUE.: Current experiment is started from	
				a restart.	
model_base_dir	C	, ,		General path which may be used in file names	
				of other name lists: If a file name contains the	
				keyword " <path>", then this model_base_dir</path>	
				will be substituted.	

4.4.20 meteogram_output_nml

Parameter	Type	Default	Unit	Unit Description	Scope
lmeteogram_enabled	L(n_dom)	FALSE.		Flag. True, if meteogram of output variables is	
				desired.	
zprefix	C(n_dom)	"METEO		string with file name prefix for output file	
		$GRAM_{-}$ "			

Parameter	Type	Default	Unit	Description Scope	ope
ldistributed	L(n-dom)	.TRUE.		Flag. Separate files for each PE.	
loutput_tiles	Г	FALSE.		Write tile-specific output for some selected	
				surface/soil fields	
n0_mtgrm	I(n-dom)	0		initial time step for meteogram output.	
ninc_mtgrm	I(n-dom)	1		output interval (in time steps)	
stationlist_tot		53.633,		list of meteogram stations (triples with lat, lon,	
		9.983,		name string)	
		'Ham-			
		burg'			
var_list	C(:)	2 2		Positive-list of variables (optional). Only	
				variables contained in this list are included in	
				the meteogram. If the default list is not	
				changed by user input, then all available	
				variables are added to the meteogram	

Defined and used in: src/namelists/mo_mtgrm_nml.f90

4.4.21 nonhydrostatic_nml (relevant if run_nml:iequations=3)

Parameter	Type	Default	Unit	Description	Scope
$itime_scheme$	I	4		Options for predictor-corrector time-stepping	
				scheme:	

Parameter	Type	Default	Unit	Description	Scope
				4: Contravariant vertical velocity is computed in the predictor step only, velocity tendencies are computed in the corrector step only (most efficient option) 5: Contravariant vertical velocity is computed in both substeps (beneficial for numerical stability in very-high resolution setups with extremely steep slops, otherwise no significant impact) 6: As 5, but velocity tendencies are also computed in both substeps (no apparent	iequations=3
rayleigh_type	Ι	2		benefit, but more expensive) Type of Rayleigh damping 1: CLASSICAL (requires velocity reference state!)	
rayleigh_coeff	R(n.dom)	0.05 for i=1		2: Klemp (2008) type Rayleigh damping coefficient $1/\tau_0$ (Klemp, Dudhia, Hassiotis: MWR136, pp.3987-4004); higher values are recommended for R2B6 or	
damp_height	R(n_dom)	45000 for i=1	m	Height at which Rayleigh damping of vertical wind starts (needs to be adjusted to model top height; the damping layer should have a depth of at least 20 km when the model top is above the stratonause)	
htop_moist_proc	R	22500.0	m	Height above which moist physics and advection of cloud and precipitation variables are turned off	
hbot_qvsubstep	R	22500.0	m	Height above which QV is advected with substepping scheme (must be at least as large as htop_moist_proc)	ihadv_tracer=22, 32, 42 or 52

H.	Type	Default	Unit	Description	Scope
R 0.15	0.15			Off-centering in vertical wind solver. Higher	
				when the model top is above 50 km.	
R -0.1	-0.1			Off-centering of density and potential	
				temperature at interface level (may be set to	
	Ç			0.0 for K2Bo of finer grids)	
R 0.23	0.25			On-centering of velocity advection in corrector step	
I 2	2			Type of vertical coordinate:	
				1: Gal-Chen hybrid	
				2: SLEVE (uses sleve_nml)	
I 25	ಬ			number of dynamics substeps per fast-physics $/$	
		_		transport step	
L TRUE.	TRUE.			.TRUE.: Compute diffusion only at advection	
				time steps (in this case, divergence damping is	
				applied in the dynamical core)	
L TRUE.	TRUE.			.TRUE.: Apply additional momentum diffusion	
				at grid points close to the stability limit for	
				vertical advection (becomes effective extremely	
				rarely in practice; this is mostly an emergency	
				fix for pathological cases with very large	
				orographic gravity waves)	
$ m R = \left 0.0025 \right $	0.0025			Scaling factor for divergence damping	$lhdiff_rcf = .TRUE.$
I 4	4			Order of divergence damping:	$lhdiff_rcf = .TRUE.$
				2 = second-order divergence damping	
				4 = fourth-order divergence damping	
				24 = combined second-order and fourth-order	
				divergence damping and enhanced vertical	
				wind off-centering during the initial spinup	
				phase (does not allow checkpointing/restarting	
_				earner than 2.5 nours of integration)	

Parameter	Type	Default	Unit	Description	Scope
divdamp_type	I	3		Type of divergence damping:	lhdiff_rcf = .TRUE.
				2 = divergence damping acting on 2D	
				divergence	
				3 = divergence damping acting on 3D	
				divergence	
				32 = combination of 3D div. damping in the	
				troposphere with transition to 2D div. damping	
				in the stratosphere	
divdamp_trans_start	R	12500.		Lower bound of transition zone between 2D	$divdamp_type = 32$
				and 3D divergence damping	
divdamp_trans_end	R	17500.		Upper bound of transition zone between 2D	$divdamp_type = 32$
				and 3D divergence damping	
$\operatorname{nest_substeps}$	I	2		Number of dynamics substeps for the child	
				patches.	
				DO NOT CHANGE!!! The code will not work	
				correctly with other values	
l_masscorr_nest	ı	FALSE.		.TRUE.: Apply mass conservation correction	
				also in nested domain	
iadv_rhotheta	Ι	2		Advection method for rho and rhotheta:	
				1: simple second-order upwind-biased scheme	
				2: 2nd order Miura horizontal	
				3: 3rd order Miura horizontal (not	
				recommended)	

Parameter	Type	Default	Unit	Description	Scope
igradp_method	Ι	ro		Discretization of horizontal pressure gradient: 1: conventional discretization with metric correction term 2: Taylor-expansion-based reconstruction of pressure (advantageous at very high resolution) 3: Similar discretization as option 2, but uses hydrostatic approximation for downward extrapolation over steep slopes 4: Cubic/quadratic polynomial interpolation for pressure reconstruction 5: Same as 4, but hydrostatic approximation for downward extrapolation over steep slopes	
l_zdiffu_t	П	TRUE.		.TRUE.: Compute Smagorinsky temperature diffusion truly horizontally over steep slopes	hdiff_order=3/5 .AND. lhdiff_temp = .true.
thslp_zdiffu	R	0.025		Slope threshold above which truly horizontal temperature diffusion is activated	hdiff_order=3/5 .AND. lhdiff_temp=.true. .AND. Lzdiffu_t=.true.
thhgtd_zdiffu	R	200	ш	Threshold of height difference between neighboring grid points above which truly horizontal temperature diffusion is activated (alternative criterion to thslp_zdiffu)	hdiff_order=3/5 .AND. lhdiff_temp=.true. .AND. l_zdiffu_t=.true.
exner_expol	ద	1./3.		Temporal extrapolation (fraction of dt) of Exner function for computation of horizontal pressure gradient. This damps horizontally propagating sound waves. For R2B5 or coarser grids, values between 1/2 and 2/3 are recommended.	
l-open_ubc	T	.FALSE.		.TRUE.: Use open upper boundary condition (rather than w=0) to allow vertical motions related to diabatic heating to extend beyond the model top	

Defined and used in: src/namelists/mo_nonhydrostatic_nml.f90

4.4.22 nwp_phy_nml

The switches for the physics schemes and the time steps can be set for each model domain individually. If only one value is specified, it is copied to all child domains, implying that the same set of parameterizations and time steps is used in all domains. If the number of values for the remaining model domains. If the time steps are not an integer multiple of the advective time step (dtime), then the time step of the given in the namelist is larger than 1 but less than the number of model domains, then the settings from the highest domain ID are used respective physics parameterization is automatically rounded to the next higher integer multiple of the advective time step.

pl_varlist		None		Name of pressure level fields to be output.	
11_variist include_last	C(:)	None TRUE.		Name of isentropic level fields to be output. Flag whether to include the last time step	
mode	I	2		1 = forecast mode, $2 = $ climate mode	
				In climate mode the time axis of the output file is set to TAXIS_ABSOLUTE. In forecast mode it is set to TAXIS_BELATIVE. Till now the	
				forecast mode only works if the output is at	
taxis tunit	_	6		multiples of 1 hour Time unit of the TAXIS BELATIVE time axis	mode=1
	1	1		1 = TUNIT_SECOND	
				$2 = \text{TUNIT_MINUTE}$	
				$3 = TUNIT_HOUR$	
				For a complete list of possible values see cdi.inc	
$output_bounds$	$\mathbb{R}(k*3)$	None		Post-processing times: start, end, increment.	
				We choose the advection time step matching or	
				following the requested output time, therefore	
				we require output_bounds(3) > dtime.	
				Multiple triples are possible in order to define	
				multiple starts/ends/intervals. See namelist	
				parameters output_start, output_end,	
				output_interval for an alternative	
_				specification of output events.	_

Parameter	Type	Default	Unit	Description	Scope
output_time_unit	П	П		Units of output bounds specification.	
				1 = second	
				2 = minute	
				3 = hour	
				4 = day	
				5 = month	
				6 = year	
$output_filename$	C	None		Output filename prefix (which may include	
				path). Domain number, level type, file number	
				and extension will be added, according to the	
				format given in namelist parameter	
				"filename_format".	
$output_grid$	П	.FALSE.		Flag whether grid information is added to	
				output.	
$output_start$	C(:)	\r \r		ISO8601 time stamp for begin of output. An	
				example for this time stamp format is given	
				below. More than one value is possible in order	
				to define multiple start/end/interval triples.	
				See namelist parameter output_bounds for an	
				alternative specification of output events.	
output_end	C(:)	/c		ISO8601 time stamp for end of output. An	
				example for this time stamp format is given	
				below. More than one value is possible in order	
				to define multiple start/end/interval triples.	
				See namelist parameter output_bounds for an	
				alternative specification of output events.	

Parameter	Type	Default	Unit	Description	Scope
output_interval	C(:)	, ,		ISO8601 time stamp for repeating output	
				intervals. We choose the advection time step	
				matching or following the requested output	
				time, therefore we require output_bounds(3)	
				> dtime. An example for this time stamp	
				format is given below. More than one value is	
				possible in order to define multiple	
				start/end/interval triples. See namelist	
				parameter output_bounds for an alternative	
				specification of output events.	
pe_placement_il	$\mathbf{I}(:)$	-1		Advanced output option: Explicit assignment	
				of output MPI ranks to the isentropic level	
				output file. At most stream_partitions_il	
				different ranks can be specified. See namelist	
				parameter pe_placement_ml for further details.	
pe_placement_hl	I(:)	-1		Advanced output option: Explicit assignment	
				of output MPI ranks to the height level output	
				file. At most stream_partitions_hl different	
				ranks can be specified. See namelist parameter	
				pe_placement_ml for further details.	
pe_placement_ml	I(:)	-1		Advanced output option: Explicit assignment	
				of output MPI ranks to the model level output	
				file. At most stream_partitions_ml different	
				ranks can be specified, out of the following list:	
				0 (num_io_procs - 1). If this namelist	
				parameters is not provided, then the output	
				ranks are chosen in a Round-Robin fashion	
				among those ranks that are not occupied by	
				explicitly placed output files.	

Parameter	Type	Default	Unit	Description	Scope
pe-placement-pl	I(:)	-1		Advanced output option: Explicit assignment of output MPI ranks to the pressure level	
				output file. At most stream_partitions_pl different ranks can be specified. See namelist parameter pe_placement_ml for further details.	
ready_file	Ö	'default'		A ready file is a technique for handling dependencies between the NWP processes. The	
				completion of the write process is signalled by	
				creating a smail me with name ready_lite. Different output_nml's may be joined together	
				to form a single ready file event. The setting of	
				ready_file = "default" does not create a	
				ready file. The ready file name may contain	
				string tokens <pre><pre>cpath></pre>, <datetime></datetime></pre> , <ddhhmmss></ddhhmmss>	
				which are substituted as described for the	
				namelist parameter filename_format.	
reg_def_mode	Ι	0		Specify if the "delta" value prescribes an	remap=1
				interval size or the total *number* of intervals:	
				0: switch automatically between increment and	
				no. of grid points, 1: reg_lon/lat_def(2)	
				specifies increment, 2: reg_lon/lat_def(2)	
				specifies no. of grid points.	
remap	Ι	0		interpolate horizontally	
				0: none	
				1: to regular lat-lon grid	
north_pole	R(2)	0,90		definition of north pole for rotated lon-lat grids.	
reg_lat_def	R(3)	None		start, increment, end latitude in degrees.	remap=1
				Alternatively, the user may set the number of	
				grid points instead of an increment. Details for	
				the setting of regular grids is given below	
				together with an example.	

Parameter	Type	Default	Unit	Description	Scope
reg_lon_def	R(3)	None		The regular grid points are specified by three	remap=1
				values: start, increment, end given in degrees.	
				Alternatively, the user may set the number of	
				grid points instead of an increment. Details for	
				the setting of regular grids is given below	
				together with an example.	
steps_per_file	Ι	-1		Max number of output steps in one output file.	
				If this number is reached, a new output file will	
				be opened.	
steps_per_file_inclfirst	Γ	see		Defines if first step is counted wrt.	
		descr.		steps_per_file files count. The default is	
				.FALSE. for GRIB2 output, and .TRUE.	
				otherwise.	
stream_partitions_hl	I	1		Splits height level output of this namelist into	
				several concurrent alternating files. See	
				namelist parameter stream_partitions_ml for	
				details.	
stream_partitions_il	Ι	1		Splits isentropic level output of this namelist	
				into several concurrent alternating files. See	
				namelist parameter stream_partitions_ml for	
				details.	
stream_partitions_ml	I	1		Splits model level output of this namelist into	
				several concurrent alternating files. The output	
				is split into N files, where the start date of	
				part i gets an offset of	
				$(i-1)*$ output_interval. The output interval	
				is then replaced by $N * \text{output_interval}$, the	
				include_last flag is set to .FALSE., the	
				steps_per_file_inclfirst flag is set to	
				.FALSE., and the steps_per_file counter is	
				set to 1.	

Parameter	Type	Defa	Unit	alt Unit Description	Scope
stream_partitions_pl	I	1		Splits pressure level output of this namelist	
				into several concurrent alternating files. See	
				namelist parameter stream_partitions_ml for	
				details.	
rbf_scale	R	-1.		Explicit setting of RBF shape parameter for	interpol_nml:rbf_scale_mode_ll
				interpolated lon-lat output. This namelist	
				parameter is only active in combination with	
				interpol_nml:rbf_scale_mode_ll=3.	

#

Defined and used in: src/io/shared/mo_name_list_output_init.f90

Interpolation onto regular grids: Horizontal interpolation onto regular grids is possible through the namelist setting remap=1, where the mesh is defined by the parameters

- reg_lon_def: mesh latitudes in degrees,
- reg_lat_def: mesh longitudes in degrees.
- north_pole: definition of north pole for rotated lon-lat grids.

The regular grid points in reg_lon_def, reg_lat_def are each specified by three values, given in degrees: start, increment, end. The mesh then contains all grid points $start + k * increment \le end$, where k is an integer. Instead of defining an increment it is also possible to prescribe the number of grid points.

- Setting the namelist parameter reg_def_mode=0: Switch automatically from increment specification to no. of grid points, when the reg_lon/lat_def(2) value is larger than 5.0.
- 1: reg_lon/lat_def(2) specifies increment
- 2: reg_lon/lat_def(2) specifies no. of grid points

For longitude values the last grid point is omitted if the end point matches the start point, e.g. for 0 and 360 degrees.

Examples

 $reg_lon_def = -30.,0.5,30.$ local grid with 0.5 degree increment:

global grid with 720x361 grid points:

0.,720,360 II reg_lon_def

90.,-0.5, -90.

reg_lat_def

= -90.360,90reg_lat_def **Time stamp format:** The namelist parameters output_start, output_end, output_interval allow the specification of time stamps according to ISO 8601. The general format for time stamps is YYYY-MM-DDThh:mm:ss where Y: year, M: month, D: day for dates, and hh: hour, mm: minute, ss: second for time strings. The general format for durations is PnYnMnDTnHnMnS. See, for example, http://en.wikipedia.org/wiki/ISO_8601 for details and further specifications.

NOTE: as the mtime library underlaying the output driver currently has some restrictions concerning the specification of durations:

- 1. Any number n in PnYnMnDTnHnMnS must have two digits. For instance use "PT06H" instead of "PT6H'
- 2. In a duration string PnyearYnmonMndayDTnhrHnminMnsecS the numbers nxyz must not pass the carry over number to the next larger time unit: 0|=nmon|=12, 0|=nhr|=23, 0|=min|=59, 0|=nsec|=59.999. For instance use "P01D" instead of "PT24H", or "PT01M" instead "S09Tq" fo

Soon the formatting problem will be resolved and the valid number ranges will be enlarged. (2013-12-16)

Examples

2013-10-27T13:41:00Z date and time representation (output_start, output_end) duration (output_interval)

POODTOGHOOMOOS

Variable Groups

Keyword "group:": Using the "group:" keyword for the namelist parameters ml_varlist, hl_varlist, pl_varlist, sets of common variables can be added to the output output of all variables (caution: do not combine with mixed vertical interpolation) time mean variables from prog_timemean,tracer_timemean, echam_timemean additional prognostic variables of the nonhydrostatic model time mean output: most echam surface variables same set as atmo_ml_vars, but expect height basic atmospheric variables on model levels same set as atmo_ml_vars, but except pres DWD first guess fields (atmosphere) DWD first guess fields (surface/soil) time mean output: temp, u, v, rho ART mineral dust aerosol fields derived atmospheric variables ART radioactive tracer fields time mean output: qv, qc, qi ART sea salt aerosol fields multi-layer snow variables ART volcanic ash fields snow variables group:additional_precip_vars group:atmo_derived_vars group:phys_tendencies group:tracer_timemean group:dwd_fg_sfc_vars group:multisnow_vars group:dwd_fg_atm_vars group:echam_timemean group:ART_AERO_RADIO group:ART_AERO_VOLC group:ART_AERO_SEAS group:prog_timemean group:atmo_timemean group:ART_AERO_DUST group:atmo_pl_vars group:atmo_zl_vars group:nh_prog_vars group:atmo_ml_vars group:precip_vars group:cloud_diag group:snow_vars group:land_vars group:rad_vars group:pbl_vars group:all

fields separately. E.g. "tiles:t_g" (read: "tiles of t_g") automatically adds all t_g_t_X fields to the output. Here, X is a placeholder for the tile number. Make sure to specify the name of the aggregated variable rather than the name of the corresponding tile container (i.e. in the Keyword "tiles:": The "tiles:" keyword allows to add all tiles of a specific variable to the output, without the need to specify all tile

given example it must be t_g, and not t_g_t!).

Note:

There exists a special syntax which allows to remove variables from the output list, e.g. if these undesired variables were contained in a previously selected group.

Typing "-jvarname;" (for example "-temp") removes the variable from the union set of group variables and other selected variables. Note that typos are not detected but that the corresponding variable is simply not removed!

Keyword substitution in output filename (filename_format):

path	substituted by model_base_dir
output_filename	substituted by output_filename
physdom	substituted by physical patch ID
levtype	substituted by level type "ML", "PL", "HL", "IL"
levtype_l	like levtype, but in lower case
jfile	substituted by output file counter
datetime	substituted by ISO-8601 date-time stamp in format YYYY-MM-DDThh:mm:ss
datetime2	substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmssZ
datetime3	substituted by ISO-8601 date-time stamp in format YYYYMMDDThhmmss.sss
ddhhmmss	substituted by relative day-hour-minute-second string
hhhmmss	substituted by relative hour-minute-second string
npartitions	If namelist is split into concurrent files: number of stream partitions.
ifile_partition	If namelist is split into concurrent files: stream partition index of this file.
total_index	If namelist is split into concurrent files: substituted by the file counter

mm:ss.ssZ

S.ssz

(like in jfile), which an "unsplit" namelist would have produced

4.4.28 run_nml

Parameter	Type	Default	Unit	Description	Scope
nsteps	I	666-		Number of time steps of this run. Allowed	
				range is ≥ 0 ; setting a value of 0 allows writing	
				initial output (including internal remapping)	
				without calculating time steps.	

Parameter	Type	Default	Unit	Description	Scope
dtime		0.009	ω	time step. For real case runs the maximum allowable time step can be estimated as 1.8 · ndyn_substeps · $\overline{\Delta x}$ s km ⁻¹ , where $\overline{\Delta x}$ is the average resolution in km and ndyn_substeps is the number of dynamics substeps set in nonhydrostatic_nml.	•
ltestcase Idynamics iforcing	JJI	.TRUE. .TRUE. 0		the default value 5. Idealized testcase runs Compute adiabatic dynamic tendencies Forcing of dynamics and transport by parameterized processes. Use positive indices for the atmosphere and negative indices for the	
				ocean. 0: no forcing 1: Held-Suarez forcing 2: ECHAM forcing 3: NWP forcing 4: local diabatic forcing with physics 5: local diabatic forcing with physics 1: MDIOM forcing (1. b. d.	
ltransport ntracer	I L	.FALSE.		Compute large-scale tracer transport Number of advected tracers handled by the	
lvert_nest	I	FALSE.		If set to .true. vertical nesting is switched on (i.e. variable mumber of vertical levels)	
num_lev	I(max. dom)	31		Number of full levels (atm.) for each domain	lvert_nest=.TRUE.

Parameter	Type	Default	Unit	Description	Scope
nshift	I(max_	0		vertical half level of parent domain which	lvert_nest=.TRUE.
	dom)			coincides with upper boundary of the current	
				domain required for vertical refinement, which	
				is not yet implemented	
ltimer	Γ	TRUE.		TRUE: Timer for monitoring the runtime of	
				specific routines is on $(FALSE = off)$	
timers_level	I	1			
activate_sync_timers	Γ	Ţ		TRUE: Timer for monitoring runtime of	
				communication routines (FALSE = off)	
${ m msg_level}$	I	10		controls how much printout is written during	
				runtime.	
				For values less than 5, only the time step is	
				written.	
msg_timestamp	T	FALSE.		If .TRUE., precede output messages by time	
				stamp.	
test_mode	I	0		Setting a value larger than 0 activates a	iequations $= 3$
				dummy mode in which time stepping is	
				changed into just doing iterations, and MPI	
				communication is replaced by copying some	
				value from the send buffer into the receive	
				buffer (does not work with nesting and reduced	
				radiation grid because the send buffer may	
				then be empty on some PEs)	
debug_check_level	I	0		Setting a value larger than 0 activates debug	
				checks.	

Parameter	Type	Default	Unit	Description [§	Scope
output	C(:)	"nml", "totint"		Main switch for enabling/disabling components of the model output. One or more choices can be set (as an array of string constants). Possible choices are:	
				• "none": switch off all output;	
				• "nml": new output mode (cf. output_nml);	
				• "totint": computation of total integrals.	
				• "maxwinds": write max. winds to separate ASCII file "maxwinds.log".	
				If the output namelist parameter is not set explicitly, the default setting "nml", "totint" is assumed.	
restart_filename	D			File name for restart/checkpoint files (containing keyword substitution patterns <gridfile>, <idom>, <rsttime>, <mtype>). default: "<gridfile>_restart_<mtype>_<rsttime> nc".</rsttime></mtype></gridfile></mtype></rsttime></idom></gridfile>	
profiling_output	Н			controls how profiling printout is written: TIMER_MODE_AGGREGATED=1, TIMER_MODE_DETAILED=2, TIMER_MODE_WRITE_FILES=3.	
lart	П	.FALSE.		Main switch which enables the treatment of atmospheric aerosol and trace gases (The ART package of KIT is needed for this purpose)	
check_uuid_gracefully	Γ	.FALSE.		If this flag is set to .TRUE. we give only warnings for non-matching UUIDs.

¹Important note: This feature is currently active for configuration dwd+cray only.

SYNMSG_RAD_CS_IR12.1

SYNMSG_BT_CS_IR12.1

SYNMSG_BT_CS_IR13.4

SYNMSG_RAD_CS_IR13.4

Here, RAD denotes radiance, BT brightness temperature, CL cloudy, and CS clear sky, supplemented by the channel name.

Defined and used in: src/namelists/mo_synsat_nml.f90

4.4.31 time_nml

Parameter	Type	Default	Unit	Description	Scope
calendar	I	1		Calendar type:	
				0=Julian/Gregorian	
				1=proleptic Gregorian	
				2=30day/month, 360day/year	
dt _restart	\mathbf{R}	86400.*30	∞	Length of restart cycle in seconds. This	
				namelist parameter specifies how long the	
				model runs until it saves its state to a file and	
				stops. Later, the model run can be resumed,	
				s. t. a simulation over a long period of time can	
				be split into a chain of restarted model runs.	
				Note that the frequency of writing restart files	
				is controlled by io_nml:dt_checkpoint. Only	
				if the value of dt_checkpoint resulting from	
				model default or user's specification is longer	
				than dt_restart, it will be reset (by the	
				model) to dt_restart so that at least one	
				restart file is generated during the restart	
				cycle. If dt_restart is larger than but not a	
				multiple of dt_checkpoint, restart file will not	
				be generated at the end of the restart cycle.	
ini_datetime_string	C	,2008-		Initial date and time of the simulation	
		09-01T			
		00:00:00Z			

Parameter	Type	Default	Unit	efault Unit Description Sco	Scope
end_datetime_string	C	,2008-		End date and time of the simulation	
		09-01T			
		01:40:00Z			
is_relative_time	J	FALSE.		TRUE, if time loop shall start with step 0	
				regardless whether we are in a standard run or	
				in a restarted run (which means re-initialized	
				run).	

Length of the run If "nsteps" in run_nml is positive, then nsteps*dtime is used to compute the end date and time of the run. Else the initial date and time, the end date and time, dt_restart, as well as the time step are used to compute "nsteps".

ICON User's Guide - 1.8.00

4.4.32 transport_nml (used if run_nml/ltransport=.TRUE.)

Parameter	Type	Default	Unit	Description	Scope
lvadv_tracer	Г	TRUE.		TRUE: compute vertical tracer advection	
				FALSE: do not compute vertical tracer	
				advection	
ihadv_tracer	I(ntracer)	2		Tracer specific method to compute horizontal	
				advection:	
				0: no horiz. transport (note that the specific	
				tracer quantity q is kept constant and not	
				tracer mass ρq)	
				1: upwind (1st order)	
				2: Miura (2nd order, linear reconstr.)	
				3: Miura3 (quadr. or cubic reconstr.)	$lsq_high_ord \in [2,3]$
				4: FFSL (quadr. or cubic reconstr.)	$lsq_high_ord \in [2,3]$
				5: hybrid Miura3/FFSL (quadr. or cubic	$lsq_high_ord \in [2,3]$
				reconstr.)	
				20: miura (2nd order, lin. reconstr.) with	
				subcycling	
				22: combination of miura and miura with	
				subcycling	
				32: combination of miura and miura with	
				subcycling	
				42: combination of FFSL and miura with	
				subcycling	

Parameter	Type	Default	Unit	Description	Scope
ivadv_tracer	I(ntracer)	8		52: combination of hybrid FFSL/Miura3 with subcycling Subcycling means that the integration from time step n to n+1 is splitted into substeps to meet the stability requirements. For NWP runs, substepping is generally applied above $z = 22 \mathrm{km}$ (see nonhydrostatic_nml/hbot_qvsubstep). Tracer specific method to compute vertical advection: 0: no vert. transport (note that tracer mass ρq instead of the specific tracer quantity q is kept constant. This differs from the behaviour in borizontal direction!	$\rm lvadv_tracer = TRUE$
iadv_tke lstrang	п 1	0 .FALSE.		1: upwind (1st order) 3: ppm_cff (3 rd order, handles CFL > 1) 30: ppm (3rd order, CFL <= 1) Type of TKE advection 0: no TKE advection 1: vertical advection only 2: vertical and horizontal advection Time splitting method TRUE: second order Strang splitting FALSE: first order Godunov splitting	inwp_turb=1
ctracer_list	O	r		Two purposes: - used for selecting those tracers which should be initialized for idealized testcases used for tracer output names. In some idealized cases tracers are named ' Qx ', with x being a 1-digit integer taken from ctracer_list.	[nh/ha]_test_name= 'jabw','PA','DF' iforcing≠ inwp, iecham

Parameter	Type	Default	Unit	Description	Scope
npassive_tracer	Ι	0		number of additional passive tracers which	
				have no sources and are transparent to any	
				physical process (no effect).	
				Passive tracers are named Qpassive_ID, where	
				ID is a number between ntracer and	
				ntracer+npassive_tracer.	
				NOTE: By default, limiters are switched of for	
				passive tracers and the scheme 52 is selected	
				for horizontal advection.	
init_formula	Ö			Comma-separated list of initialization formulas	npassive_tracer; 0
				for additional passive tracers.	
$itype_hlimit$	I(ntracer)	4		Type of limiter for horizontal transport:	
				0: no limiter	
				3: monotonous flux limiter	
				4: positive definite flux limiter	
itype_vlimit	I(ntracer)	1		Type of limiter for vertical transport:	
				0: no limiter	
				1: semi-monotone slope limiter	
				2: monotonous slope limiter	
				4: positive definite flux limiter	
niter_fct	Ι	1		number of iterations of monotone flux	$itype_hlimit = 3$
				correction procedure (experimental!)	
beta_fct	$_{ m R}$	1.005		factor of allowed over-/undershooting in	itype_hlimit = 3
				monotonous limiter	
iord_backtraj	Ι	-		order of backward trajectory calculation:	
				1: first order	
				2: second order (iterative; currently 1 iteration	ihadv_tracer='miura'
				hardcoded; experimental!)	
igrad_c_miura	I	1		Method for gradient reconstruction at cell	
				center for 2nd order miura scheme	
				1: Least-squares (linear, non-consv)	ihadv_tracer=2

Parameter	Type	Default	Unit	Default Unit Description	Scope
				2: Green-Gauss	
ivcfl_max	I	5		determines stability range of vertical	ivadv_tracer=3
				PPM-scheme in terms of the maximum	
				allowable CFL-number

4.4.33 turbdiff_nml

Parameter	Type	Default	Unit	Default Unit Description	Scope
imode_turb	I	1		Mode of solving the TKE equation for	
				atmosph. layers:	
				0: diagnostic equation	
				1: prognostic equation (current version)	
				2: prognostic equation (intrinsically positive	
				definite)	
imode_tran	I	0		Same as <i>imode_turb</i> but only for the transfer	
				layer	

Parameter	Type	Default	Unit	Description	Scope
icldm_turb	Н	2		Mode of water cloud representation in turbulence for atmosph. layers: -1: ignoring cloud water completely (pure dry scheme) 0: no clouds considered (all cloud water is	
icldm tran	F	6		evaporated) 1: only grid scale condensation possible 2: also sub grid (turbulent) condensation considered Same as icldm turb but only for the transfer	
itype_wcld	- н	1 2		layer type of water cloud diagnosis within the	icldm_turb=2 or icldm_tran=2
itype_sher	Н	0		1: employing a scheme based on relative humitidy 2: employing a statistical saturation adjustment Type of shear forcing used in turbulence: 0: only vertical shear of horizontal wind 1: previous plus horizontal shear correction 2: previous plus shear from vertical velocity 2: previous plus shear from vertical velocity	
ltkeshs	L	.FALSE.		Itkeshs=.TRUE.) scaling of coarse-grid horizontal shear production term with $\frac{1}{\sqrt{Ri}}$ Include correction term for coarse grids in horizontal shear production term (needed at non-convection-resolving model resolutions in order to set a non-needigible impact)	itype_sher ≥ 1
Itkesso	П	FALSE.		Consider TKE-production by sub grid SSO wakes	$invp_soo = 1$
ltkecon	Γ	FALSE.		Consider TKE-production by sub grid convective plumes (inactive)	$inwp_conv = 1$

Parameter	Type	Default	Unit	Description	Scope
ltkeshs	Γ	.FALSE.		Consider TKE-production by separated	
				horizontal shear eddies (inactive)	
ltmpcor	J	FALSE.		Consider thermal TKE sources in enthalpy	
	,			equation	
Isflend	J	TRUE.		Use lower flux condition for vertical diffusion	
				calculation (TRUE) instead of a lower	
				concentration condition (FALSE)	
lexpcor	Г	FALSE.		Explicit corrections of implicitly calculated	
				vertical diffusion of non-conservative scalars	
				that are involved in sub grid condensation	
				processes	
tur_len	R	500.0	m	Asymptotic maximal turbulent distance	
				$(\kappa * tur_len$ is the integral turbulent master	
				length scale)	
pat_len	\mathbf{R}	100.0	m	Effective length scale of thermal surface	
				patterns controlling TKE-production by sub	
				grid kata/ana-batic circulations. In case of	
				$pat_len = 0$, this production is switched off.	
c_diff	R	0.2	П	Length scale factor for vertical diffusion of	
				TKE. In case of $cdiff = 0$, TKE is not	
				diffused vertically.	
a_stab	m R	0.0	1	Factor for stability correction of turbulent	
				length scale. In case of $a_stab = 0$, the	
				turbulent length scale is not reduced for stable	
				stratification.	
a_hshr	R	0.20	1	Length scale factor for the separated horizontal	ltkeshs=.TRUE.
				shear mode. In case of $ahshr = 0$, this shear	
				mode has no effect.	
alpha0	R	0.0123	1	Lower bound of velocity-dependent Charnock	
				parameter	

Parameter	Type	Default	Unit	Description	Scope
alpha0_max	R	0.0335	1	Upper bound of velocity-dependent Charnock	
				parameter. Setting this parameter to 0.0335 or	
				higher values implies unconstrained velocity	
				dependence	
tkhmin	\mathbf{R}	0.75	$ \mathrm{m}^2/\mathrm{s} $	Scaling factor for minimum vertical diffusion	
				coefficient (proportional to $1/\sqrt{Ri}$) for heat	
				and moisture	
tkmmin	$_{ m R}$	0.75	$ m^2/s $	Scaling factor for minimum vertical diffusion	
				coefficient (proportional to $1/\sqrt{Ri}$) for	
				momentum	
tkmmin_strat	R	ಬ	$ m^2/s $	Enhanced scaling factor for minimum vertical	
				diffusion coefficient (proportional to $1/\sqrt{Ri}$)	
				for momentum, valid in the stratosphere above	
				30 km	
tkhmin_strat	$_{ m R}$	ъ	$ m^2/s $	Enhanced scaling factor for minimum vertical	
				diffusion coefficient (proportional to $1/\sqrt{Ri}$)	
				for heat and moisture, valid in the stratosphere	
				above 30 km	
itype_synd	Ι	2		Type of diagnostics of synoptic near surface	
				variables:	
				1: Considering the mean surface roughness of a	
				grid box	
				2: Considering a fictive surface roughness of a	
				SYNOP lawn	
rlam_heat	\mathbf{R}	1.0	1	Scaling factor of the laminar boundary layer	
				for heat (scalars). The larger rlam heat, the	
				larger is the laminar resistance.	
rat_sea	\mathbf{R}	10.0	1	Ratio of laminar scaling factors for scalars over	
				sea and land. The larger rat_sea, the larger is	
				the laminar resistance for a sea surface	
				compared to a land surface.	

Parameter	Type	Default	Unit	Description	Scope
tkesmot	R	0.15	1	Time smoothing factor within $[0,1]$ for TKE.	
				In case of $tkesmot = 0$, no smoothing is active.	
fresmot	R	0.0		Vertical smoothing factor within [0, 1] for TKE	
				forcing terms. In case of $fremot = 0$, no	
				smoothing is active.	
imode_frcsmot	I	1		1 = apply vertical smoothing (if frcsmot>0)	
				uniformly over the globe	
				2 = restrict vertical smoothing to the tropics	
				(reduces the moist bias in the tropics while	
				avoiding adverse effects on NWP skill scores in	
				the extratropics)	
impl_s	В	1.20	П	Implicit weight near the surface (maximal	
				value)	
impl_t	R	0.75	1	Implicit weight near top of the atmosphere	
				(minimal value)	
lconst_z0	Γ	FALSE.		TRUE: horizontally homogeneous roughness	
				length z0	
const_z0	\mathbb{R}	0.001	m	value for horizontally homogeneous roughness	lconst_z0=.TRUE.
				length z0	
ldiff_qi	Γ	FALSE.		Turbulent diffusion of cloud ice, if .TRUE.	
itype_tran	I	2		type of surface-atmosphere transfer	
lprfcor	Γ	FALSE.		using the profile values of the lowest main level	
				instead of the mean value of the lowest layer	
				for surface flux calculations	
Inonloc	Γ	FALSE.		nonlocal calculation of vertical gradients used	
				for turbul. diff.	
lfreeslip	П	.FALSE.		.TRUE.: use a free-slip lower boundary	
				condition, i.e. neither momentum nor	
				heat/moisture fluxes (use for idealized runs	
				$\operatorname{only!}$	

Parameter	Type	Default	Unit	Description	Scope
cpfluc	Г	.FALSE.		consideration of fluctuations of the heat	
				capacity of air	

Defined and used in: src/namelists/mo_turbdiff_nml.f90

4.4.34 vdiff_nml

Parameter	Type	Default	Unit	Description	Scope
lsfc_mon_flux	Γ	TRUE.		Switch on surface momentum flux.	lvdiff = .TRUE.
lsfc_heat_flux	Γ	TRUE.		Switch on surface sensible and latent heat flux.	lvdiff = .TRUE.

Defined and used in: src/namelists/mo_vdiff_nml.f90

4.5 Ocean-specific namelist parameters

4.5.1 ocean_physics_nml

Parameter	Type	Default	Unit	Default Unit Description	Scope
i_sea_ice	П	1		0: No sea ice, 1: Include sea ice	
				.FALSE.: compute drag only	
richardson_factor_tracer	П	0.5e-5	s/m		
richardson_factor_veloc	П	0.5e-5	s/m		
l_constant_mixing	П	.FALSE.			

4.5.2 sea_ice_nml (relevant if run_nml/iforcing=2 (ECHAM))

Parameter	Type	Default	Unit	Description	Scope
i_ice_therm	I	2		Switch for thermodynamic model:	In an ocean run
				1: Zero-layer model	i_sea_ice must be ;=1.
				2: Two layer Winton (2000) model	In an atmospheric run
				3: Zero-layer model with analytical forcing (for	the ice surface type
				diagnostics)	must be defined.
				4: Zero-layer model for atmosphere-only runs	
				(for diagnostics)	
i_ice_dyn	I	0		Switch for sea-ice dynamics:	
				0: No dynamics	
				1: FEM dynamics (from AWI)	
i_ice_albedo	I			Switch for albedo model. Only one is	
				implemented so far.	
i_Qio_type	Ι	2		Switch for ice-ocean heat-flux calculation	Defaults to 1 when
				method:	i_ice_dyn=0 and 2
				1: Proportional to ocean cell thickness (like	otherwise.
				MPI-OM)	
				2: Proportional to speed difference between ice	
				and ocean	
kice	I	1		Number of ice classes (must be one for now)	
hnull	$_{ m R}$	0.5	m	Hibler's h_0 parameter for new-ice growth.	
hmin	$_{ m R}$	0.05	m	Minimum sea-ice thickness allowed.	
ramp_wind	R	10	days	Number of days it takes the wind to reach	
				correct strength. Only used at the start of an	
				OMIP/NCEP simulation (not after restart).	

4.6 Namelist parameters for testcases (NAMELIST_ICON)

The ICON model code includes several experiments, so-called test cases, for the shallow water model as well as the 3-dimensional atmosphere. Depending on the specified experiment, initial conditions and boundary conditions are computed internally.

4.6.1 ha_testcase_nml (Scope: Itestcase=.TRUE. and iequations=[0,1,2] in run_nml)

Parameter	Type	Default	Unit	Description	Scope
ctest_name	C	'JWw'		Name of test case:	
				'SW_GW': gravity wave	lshallow_water=.TRUE.
				'USBR': unsteady solid body rotation	lshallow_water=.TRUE.
				'Will_2': Williamson test 2	lshallow_water=.TRUE.
				'Will_3': Williamson test 3	lshallow_water=.TRUE.
				'Will_5': Williamson test 5	lshallow_water=.TRUE.
				'Will_6': Williamson test 6	lshallow_water=.TRUE.
				'GW': gravity wave $(nlev=20 \text{ only!})$	lshallow_water=.FALSE.

4.9 Information on vertical level distribution

If no vertical sleve coordinate is chosen (ivctype /=2), the hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coordinates. The hybrid level specification is stored in <icon home>/hyb_params/HYB_PARAMS_<nlev>. The hydrostatic model assumes to get pressure based coordinates, the nonhydrostatic model expects height based coordinates. For further information see <icon home>/hyb_params/README.
