#### 1 ICON Namelists

#### 1.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the grid generation and the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in <icon home>/build/<architecture>/bin/.

Table 1: Namelist files

Namelist file	Purpose	Made by script	Used by program
NAMELIST_GRAPH	Generate graphs	create_global_grids.run	grid_command
$NAMELIST\_GRID$	Generate grids	$create\_global\_grids.run$	$\operatorname{grid} \operatorname{\_command}$
$NAMELIST\_GRIDREF$	Gen. nested domains	create_global_grids.run	grid_command
NAMELIST_OCEAN_GRID	Gen. ocean grid	create_ocean_grid.run	grid_command
NAMELIST TORUS GRID	Gen. torus grid	create torus grid.run	grid command
NAMELIST ICON	Run ICON models	exp. <name>.run</name>	control model

#### 1.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- Type refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- ullet Default is the preset value, if defined, that is assigned to this parameter within the programs.
- *Unit* shows the unit of the control parameter, where applicable.
- $\bullet$  Description explains in a few words the purpose of the parameter.
- Scope explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

### 2 Namelist parameters for grid generation

#### 2.1 Namelist parameters defining the atmosphere grid

### 2.1.1 graph\_ini (NAMELIST\_GRAPH)

Parameter	Type	Default	Unit	Description	Scope
nroot	I	2		root subdivision of initial edges	
grid_levels	I	4		number of edge bisections following the root	
				subdivision	
lplane	L	.FALSE.		switch for generating a double periodic planar grid.	
				The root level consists of 8 triangles.	

Defined and used in: src/grid generator/mo io graph.f90

### 2.1.2 grid\_ini (NAMELIST\_GRID)

Parameter	Type	Default	Unit	Description	Scope
nroot	I	2		root subdivision of initial edges	
grid_levels	I	4		number of edge bisections following the root	
				subdivision	
lplane	L	.FALSE.		switch for generating planar grid. The root level	
				consists of 8 triangles.	

Defined and used in:  $src/grid\_generator/mo\_io\_grid.f90$ 

### 2.1.3 grid\_options (NAMELIST\_GRID)

Parameter	Type	Default	Unit	Description	Scope
x_rot_angle	R	0.0	deg	Rotation of the icosahedron about the x-axis	
				(connecting the origin and [0°E, 0°N])	

Parameter	Type	Default	Unit	Description	Scope
y_rot_angle	R	0.0	deg	Rotation of the icosahedron about the y-axis	
				(connecting the origin and [90°E, 0°N), done after	
				the rotation about the x-axis.	
z_rot_angle	R	0.0	deg	rotation of the icosahedron about the z-axis	
				(connecting the origin and [0°E, 90°N), done after	
				the rotation about the y-axis.	
itype_optimize	I	4		Grid optimization type	
				0: no optimization	
				1: Heikes Randall	
				2: equal area	
				3: c-grid small circle	
				4: spring dynamics	
l_c_grid	L	.FALSE.		C-grid constraint on last level	
maxlev_optim	I	100		Maximum grid level where the optimization is	$i_{type_optimize} = 1 \text{ or } 4$
				applied	
beta_spring	R	0.90		tuning factor for target grid length	$i\_type\_optimize = 4$

Defined and used in: src/grid generator/mo io grid.f90

#### 2.1.4 plane options (NAMELIST GRID)

Parameter	Type	Default	Unit	Description	Scope
tria_arc_km	R	10.0	km	length of triangle edge on plane	lplane=.TRUE.

The number of grid points is generated by root level section and further bisections. The double periodic root level consists of 8 triangles. The spatial coordinates are -1 <= x <= 1, and  $-\sqrt{3}/2 <= y <= \sqrt{3}/2$ . Currently the planar option can only be used as an f-plane. Defined and used in:  $src/grid\_generator/mo\_io\_grid.f90$ 

#### 2.1.5 gridref\_ini (NAMELIST\_GRIDREF)

Parameter Ty	Гуре	Default	Unit	Description	Scope
--------------	------	---------	------	-------------	-------

Parameter	Type	Default	Unit	Description	Scope
grid_root	I	2		root subdivision of initial edges	
start_lev	I	4		number of edge bisections following the root	
				subdivision	
n_dom	I	2		number of logical model domains, including the	
				global one	
n_phys_dom	I	n_dom		number of physical model domains, may be larger	
				than n_dom (in this case, domain merging is	
				applied)	
parent_id	I(n_phy	rsi_		ID of parent domain (first entry refers to first	
	dom-			nested domain; needs to be specified only in case of	
	1)			more than one nested domain per grid level)	
logical_id	I(n_phy	rsi+1		logical grid ID of parent domain (first entry refers	
	dom-			to first nested domain; needs to be specified only in	
	1)			case of domain merging, i.e. n_dom <	
				n_phys_dom)	
l_plot	L	.FALSE.		produces GMT plots showing the locations of the	
				nested domains	
l_circ	L	.TRUE.		Create circular (.T.) or rectangular (.F.) refined	
				domains	
l_rotate	L	.FALSE.		Rotates center point into the equator in case of	lcirc=.FALSE.
				$l\_circ = .FALSE.$	
write_hierarchy	I	1		0: Output only computational grids	
				1: Output in addition parent grid of global model	
				domain (required for computing physics on a	
				reduced grid)	
				2: Output all grids back to level 0 (required for	
				hierarchical search algorithms)	
bdy_indexing_depth	h I	$\max_{\text{rlcell}}$		Number of cell rows along the lateral boundary of a	
		(=8)		model domain for which the refin_ctrl fields	
				contain the distance from the lateral boundary;	
				needs to be enlarged when lateral boundary	
				nudging is required for one-way nesting	

Parameter	Type	Default	Unit	Description	Scope
radius	R(n_dc	m <b>3</b> 0.	deg	radius of nested domain (first entry refers to first	lcirc=.TRUE.
	1)			nested domain; needs to be specified for each nested	
				domain separately)	
hwidth_lon	R(n_dc	m <b>2</b> 0.	deg	zonal half-width of refined domain (first entry refers	lcirc = .FALSE.
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	
hwidth_lat	R(n_dc	m20.	deg	meridional half-width of refined domain (first entry	lcirc=.FALSE.
	1)			refers to first nested domain; needs to be specified	
				for each nested domain separately)	
center_lon	R(n_dc	m90.	deg	center longitude of refined domain (first entry refers	
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	
center_lat	R(n_dc	m30.	deg	center latitude of refined domain (first entry refers	
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	

Defined and used in: src/grid\_generator/mo\_gridrefinement.f90

### $2.2 \quad \text{Namelist parameters defining the ocean grid (NAMELIST\_OCEAN\_GRID)}$

The ocean grids are created by the script run/create\_ocen\_grid.run

### ${\bf 2.2.1} \quad {\bf grid\_geometry\_conditions}$

Parameter	Type	Default	Unit	Description	Scope
no_of_conditions	Ι	0		Number of geometric conditions	
patch_shape	I(no_of	_@onditions)		1=rectangle; 2=circle	
patch_center_x	R(no_o	$f_0 \cos \theta$ ditions	) degrees	longitude of patch center	
patch_center_y	R(no_o	$f_0 \cos \theta$	) degrees	latitude of patch center	
rectangle_xradious	R(no_o	$f_0 \cos \theta$ ditions	) degrees	half meridional extension of a rectangular patch	$patch\_shape=1$
rectangle_yradious	· —	_	, ,	half zonal extension of a rectangular patch	$patch\_shape=1$
circle_radious	R(no_o	$f_0 \cos \theta$	) degrees	radius of a circular patch	$patch\_shape=2$

Defined in mo\_grid\_conditions.f90

### 2.2.2 create\_ocean\_grid

Parameter	Type	Default	Unit	Description	Scope
only_get_sea_land	rhask	.false.		.true.:returns the whole grid with a sea-land mask;	
				.false.:returns only the ocean grid	
smooth_ocean_bour	ıdary	.true.		.true.:smooths the ocean boundaries so no triabgle	
				has two boundary edges; .false.:no smoothing	
input_file	С			name of the input grid file	
elevation_file	С			name of the file containing cell elevation values for	$no\_of\_conditions=0$
				the input_file	
elevation_field	С			name of the field containing the cell elevation values	$no\_of\_conditions=0$
min_sea_depth	R	0.0	m	if cell elevation < min_sea_depth then the cell is	
			(nega-	consider sea	
			tive)		
set_sea_depth	R	0.0	m	if not 0, then sea cells are of set_sea_depth	
			(nega-	elevation	
			tive)		
set_min_sea_depth	R	0.0	m	if not 0, then sea cells have a maximum of	
			(nega-	set_min_sea_depth elevation	
			tive)		
edge_elev_interp_n	$_{ m lethod}$	2		compute edge elevation from cells using: linear	
				interpolation=1; min value = $2$	
output_refined_ocea	n <u>C</u> file			name of the output refined ocean grid file	

Defined in mo\_create\_ocean\_grid.f90

### ${\bf 2.3}\quad {\bf Namelist\ parameters\ defining\ the\ torus\ grid\ (NAMELIST\_TORUS\_GRID)}$

#### 2.3.1 torus grid parameters

Parameter	Type	Default	Unit	Description	Scope
y_no_of_rows	Ι		4	number of triangle rows of the torus grid	
x_no_of_columns	I		8	number of triangle columns of the torus grid	
edge_length	R	m	1000.0	the triangle edge length	
x_center	R	m	0.0	the x coordinate of the torus center	
y_center	R	m	0.0	the y coordinate of the torus center	
out_file_name	С			the torus grid file name	
unfolded_torus_file	nGme			the unfolded torus grid file name (for plotting)	
ascii_filename	С			the unfolded torus grid ascci file name (for plotting)	

Defined in mo\_create\_torus\_grid.f90. See the run script run/create\_torus\_grid.run.

## 3 Namelist parameters defining the ICON model

Namelist parameters for the ICON models are organized in several thematic Fortran namelists controling the experiment, and the properties of dynamics, transport, physics etc.

### 3.1 master nml

Parameter	Type	Default	Unit	Description	Scope
lrestart	L	.FALSE.		If .TRUE., simulation starts from a model state	
				read from restart file(s).	
atmo_restart_info_	fil <b>©</b> name	'restart.info	,	Name (including full path) of the restart info file for	
				the atm model	
ocean_restart_info_	fi@name	'restart.info	,	Name (including full path) of the restart info file for	
				the ocean model	
atmo_namelist_filer	a <b>6</b> ie	'NAMELIS	$T_{ICON}$	Name (including full path) of the	
				atmosphere-specific namelist file	
ocean_namelist_file	naGhe	'NAMELIS	$T_{ICON}$	Name (including full path) of the ocean-specific	
				namelist file	

## $3.2 \quad time\_nml$

Parameter	Type	Default	Unit	Description	Scope
dt_restart	R	86400.*30.	S	Length of restart cycle in seconds.	
calendar	Ι	1		Calendar type:	
				0=Julian/Gregorian	
				1=proleptic Gregorian	
				$2=30  ext{day/month,} 360  ext{day/year}$	
ini_datatime_string	С	'2008-09-		Initial date and time of the simulaiton.	
		01T00:00:0	0 <b>Z</b> '		
end_datatime_string	g C	2008-09-		End date and time of the simulaiton.	
		01T01:40:0	0 <b>Z</b> '		
				Length of the run	
				If "nsteps" in run_nml (see below) is positive, then	
				nsteps*dtime is used to compute the end date and	
				time of the run.	
				Else the initial date and time, the end date and	
				time, dt_restart, as well as the time step are used	
				to compute "nsteps".	

### 3.3 parallel\_nml

Parameter	Type	Default	Unit	Description	Scope
nproma	I	1		chunk length	
n_ghost_rows	I	1		number of halo cell rows	
l_log_checks	L				
l_fast_sum	L				
division_method	I	1		method of domain decomposition	
				0: read in from file	
				1: use built-in geometric subdivision	
				2: use METIS	
p_test_run	L	.FALSE.		.TRUE. means verification run for MPI	
				parallelization (PE 0 processes full domain)	

Parameter	Type	Default	Unit	Description	Scope
l_test_openmp	L	.FALSE.		if .TRUE. is combined with p_test_run=.TRUE.	
				and OpenMP parallelization, the test PE gets only	
				1 thread in order to verify the OpenMP	
				paralllelization	
l_log_checks	L	.FALSE.		if .TRUE. messages are generated during each	
				synchonization step (use for debugging only)	
l_fast_sum	L	.FALSE.		if .TRUE., use fast (not	
				processor-configuration-invariant) global summation	
iorder_sendrecv	I	1		Sequence of send/receive calls: $1 = \text{irecv/send}$ ; $2 =$	
				isend/recv; $3 = $ isend/irecv	
itype_comm	I	1		1: use local memory for exchange buffers	
				2: use global memory for exchange buffers	
				3: asynchronous halo communication for dynamical	
				core (NH tria only)	
num_io_procs	I	0		Number of I/O processors (running exclusively for	
				doing I/O)	
pio_type	I	1		Type of parallel I/O. Only used if number of I/O	
				processors greater number of domains.	
				Experimental!	

Defined and used in:  $src/namelists/mo\_parallel\_nml.f90$ 

### $3.4 \quad run\_nml$

Parameter	Type	Default	Unit	Description	Scope
ldump_states	L	.FALSE.		Dump patch/interpolation/grid refinement state of	
				every patch (after subdivision in case of a parallel	
				run) to a Netcdf file and exit program.	
lrestore_states	L	.FALSE.		Restore patch/interpolation/grid refinement states	
				from NetCDF dump files instead of calculating	
				them.	
nsteps	I	0		number of time steps of this run.	

Parameter	Type	Default	Unit	Description	Scope
dtime	R	600.0	S	time step	
ltestcase	L	.TRUE.		Idealized testcase runs	
ldynamics	L	.TRUE.		Compute adiabatic dynamic tendencies	
iforcing	I	0		Forcing of dynamics and transport by	
				parameterized processes. Use positive indices for	
				the atmosphere and negative indices for the ocean.	
				0: no forcing	
				1: Held-Suarez forcing	
				2: ECHAM forcing	
				3: NWP forcing	
				4: local diabatic forcing without physics	
				5: local diabatic forcing with physics	
				-1: MPIOM forcing (to be done)	
ltransport	L	.FALSE.		Compute large-scale tracer transport	
ntracer	I	0		Number of advected tracers handled by the	
				large-scale transport scheme	
lvert_nest	L	.FALSE.		If set to .true. vertical nesting is switched on (i.e.	
				variable number of vertical levels)	
nlev	I	31		Number of vertical layers	$lvert\_nest=.FALSE.$
num_nlev	I(max_	domin)		Number of full levels (atm.) for each domain	lvert_nest=.TRUE.
nshift	I(max_	dom)		vertical half level of parent domain which coincides	lvert_nest=.TRUE.
				with upper boundary of the current domain	
ltimer	L	.TRUE.		TRUE: Timer for monitoring thr runtime of specific	
				routines is on $(FALSE = off)$	
timers_level	I	1			
msg_level	I	10		controls how much printout is written during	
				runtime.	
				For values less than 5, only the time step is written.	

Defined and used in:  $src/namelists/mo\_run\_nml.f90$ 

# $3.5 \quad ha\_testcase\_nml \; (Scope: \; ltestcase=.TRUE. \; and \; iequations=[0,1,2] \; in \; run\_nml)$

Parameter	Type	Default	Unit	Description	Scope
ctest_name	С	'JWw'		Name of test case:	
				'SW_GW': gravity wave	lshallow_water=.TRUE.
				'USBR': unsteady solid body rotation	lshallow_water=.TRUE.
				'Will_2': Williamson test 2	lshallow_water=.TRUE.
				'Will_3': Williamson test 3	lshallow_water=.TRUE.
				'Will_5': Williamson test 5	lshallow_water=.TRUE.
				'Will_6': Williamson test 6	$lshallow\_water=.TRUE.$
				'GW': gravity wave (nlev=20 only!)	lshallow_water=.FALSE.
				'LDF': local diabatic forcing test without physics	lshallow_water=.FALSE.
					and iforcing=4
				'LDF-Moist': local diabatic forcing test with	lshallow_water=.FALSE.,
				physics initalised with zonal wind field	and iforcing=5
				'HS': Held-Suarez test	lshallow_water=.FALSE.
				'JWs': Jablonowski-Will. steady state	$lshallow_water=.FALSE.$
				'JWw': Jablonowski-Will. wave test	$lshallow_water=.FALSE.$
				'JWw-Moist': Jablonowski-Will. wave test	$lshallow_water=.FALSE.$
				including moisture	
				'APE': aqua planet experiment	lshallow_water=.FALSE.
				'MRW': mountain induced Rossby wave	lshallow_water=.FALSE.
				'MRW2': modified mountain induced Rossby wave	lshallow_water=.FALSE.
				'PA': pure advection	lshallow_water=.FALSE.
				'SV': stationary vortex	lshallow_water=.FALSE.,
					ntracer = 2
				'DF1': deformational flow test 1	
				'DF2': deformational flow test 2	
				'DF3': deformational flow test 3	
				'DF4': deformational flow test 4	
				'RH': Rossby-Haurwitz wave test	lshallow_water=.FALSE.
rotate_axis_deg	R	0.0	deg	Earth's rotation axis pitch angle	ctest_name= 'Will_2',
					'Will_3', 'JWs', 'JWw',
					'PA', 'DF1234'
gw_brunt_vais	R	0.01	1/s	Brunt Vaisala frequency	ctest_name= 'GW'

## $3.7 \quad \mathrm{grid\_nml}$

Parameter	Type	Default	Unit	Description	Scope
cell_type	I	3		Cell type	
				3: triangular cells	
				4: quadrilateral cells (to be done)	
				6: pentagonal/hexagonal cells	
lplane	L	.FALSE.		planar option	
corio_lat	R	0.0	deg	Center of the f-plane is located at this geographical	lplane=.TRUE.
				latitude	
n_dom	I	1		number of model domains, $1 = \text{global domain only}$	
l_limited_area	L	.FALSE.			
parent_id	I(n_doi	n-i		ID of parent domain (first entry refers to first	n_dom>1
	1)			nested domain; needs to be specified only in case of	
				more than one nested domain per grid level)	
				MUST be the same as in gridref_ini	
lfeedback	L(n_do	m)TRUE.		Specifies if feedback to parent grid is performed.	n_dom>1
				Setting lfeedback(1)=.false. turns off feedback for	
				all nested domains; to turn off feedback for selected	
				nested domains, set $lfeedback(1) = .true$ . and set	
				".false." for the desired model domains	

Parameter	Type	Default	Unit	Description	Scope
patch_weight	R(n_do			If patch_weight is set to a value > 0 for any of the first level child patches, processor splitting will be performed, i.e. every of the first level child patches gets a subset of the total number or processors corresponding to its patch_weight. A value of 0. corresponds to exactly 1 processor for this patch, regardless of the total number of processors. For the root patch and higher level childs, patch_weight is not used. However, patch_weight must be set to 0 for these patches to avoid confusion.	n_dom>1
lpatch0	L	.FALSE.		If set to .true. an additional patch one level below the root patch is allocated and read so that physics calculations on a coarser grid are possible	
lredgrid_phys	L	.FALSE.		If set to .true. is calculated on a reduced grid (= one grid level higher); requires lpatch0=.TRUE.	
dynamics_grid_ filename	С			Array of the grid filenames to be used by the dycore.	
dynamics_parent_ grid_id	I			Array of the indexes of the parent grid filenames, as described by the dynamics_grid_filename array.  Indexes start at 1, an index of 0 indicates no parent.	
radiation_grid_ filename	С			Array of the grid filenames to be used for the radiation model. Filled only if the radiation grid is different from the dycore grid.	
dynamics_radiation _grid_link	I			Array of the indexes linking the dycore grids, as described by the dynamics_grid_filename array, and the radiation_grid_filename array. It provides the link index of the radiation_grid_filename, for each entry of the dynamics_grid_filename array. Indexes start at 1, an index of 0 indicates that the radiation grid is the same as the dycore grid. Only needs to be filled when the radiation_grid_filename is defined.	

## $3.8 \quad \text{gridref\_nml}$

Defined and used in: src/namelists/mo\_gw\_hines\_nml.f90

### 3.24 Namelist parameters for testcases (NAMELIST ICON)

The ICON model code includes several experiments, so-called test cases, for the shallow water model as well as the 3-dimensional atmosphere. Depending on the specified experiment, initial conditions and boundary conditions are computed internally.

### 4 Externally provided data

### 4.1 ext par ctl (Scope: itopo=1 in run nml)

Parameter	Type	Default	Unit	Description	Scope
itopo	I	0		0: analytical topography/ext. data	
				1: topography/ext. data read from file	
n_iter_smooth_top	οI	35		iterations of topography smoother	itopo = 1
fac_smooth_topo	R	0.015625		pre-factor of topography smoother	$\begin{array}{c} \text{n\_iter\_smooth\_topo} > \\ 0 \end{array}$

Defined and used in: src/namelists/mo global variables.f90

#### 4.2 Information on vertical level distribution

The hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coorindates. The hybrid level specification is stored in <icon home>/hyb\_params/HYB\_PARAMS\_<nlev>. The hydrostatic model assumes to get pressure based coordinates, the nonhydrostatic model expects height based coordinates. For further information see <icon home>/hyb params/README.
