#### 1 ICON Namelists

#### 1.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the grid generation and the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in <icon home>/build/<architecture>/bin/.

Table 1: Namelist files

Namelist file	Purpose	Made by script	Used by program
NAMELIST_GRAPH	Generate graphs	create_global_grids.run	grid_command
NAMELIST_GRID	Generate grids	$create\_global\_grids.run$	$\operatorname{grid} \operatorname{\_command}$
NAMELIST_GRIDREF	Gen. nested domains	create_global_grids.run	grid_command
NAMELIST_OCEAN_GRID	Gen. ocean grid	create_ocean_grid.run	grid_command
NAMELIST TORUS GRID	Gen. torus grid	create torus grid.run	grid command
NAMELIST ICON	Run ICON models	exp. <name>.run</name>	control model

#### 1.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- Type refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- ullet Default is the preset value, if defined, that is assigned to this parameter within the programs.
- *Unit* shows the unit of the control parameter, where applicable.
- $\bullet$  Description explains in a few words the purpose of the parameter.
- Scope explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

## 2 Namelist parameters for grid generation

#### 2.1 Namelist parameters defining the atmosphere grid

### ${\bf 2.1.1} \quad {\bf graph\_ini} \ ({\bf NAMELIST\_GRAPH})$

Parameter	Type	Default	Unit	Description	Scope
nroot	I	2		root subdivision of initial edges	
grid_levels	I	4		number of edge bisections following the root	
				subdivision	
lplane	L	.FALSE.		switch for generating a double periodic planar grid.	
				The root level consists of 8 triangles.	

Defined and used in: src/grid generator/mo io graph.f90

### 2.1.2 grid\_ini (NAMELIST\_GRID)

Parameter	Type	Default	Unit	Description	Scope
nroot	I	2		root subdivision of initial edges	
grid_levels	I	4		number of edge bisections following the root	
				subdivision	
lplane	L	.FALSE.		switch for generating planar grid. The root level	
				consists of 8 triangles.	

Defined and used in:  $src/grid\_generator/mo\_io\_grid.f90$ 

### ${\bf 2.1.3 \quad grid\_options} \; ({\bf NAMELIST\_GRID})$

Parameter	Type	Default	Unit	Description	Scope
x_rot_angle	R	0.0	deg	Rotation of the icosahedron about the x-axis	
				(connecting the origin and [0°E, 0°N])	

Parameter	Type	Default	Unit	Description	Scope
y_rot_angle	R	0.0	deg	Rotation of the icosahedron about the y-axis	
				(connecting the origin and [90°E, 0°N), done after	
				the rotation about the x-axis.	
z_rot_angle	R	0.0	deg	rotation of the icosahedron about the z-axis	
				(connecting the origin and [0°E, 90°N), done after	
				the rotation about the y-axis.	
itype_optimize	I	4		Grid optimization type	
				0: no optimization	
				1: Heikes Randall	
				2: equal area	
				3: c-grid small circle	
				4: spring dynamics	
l_c_grid	L	.FALSE.		C-grid constraint on last level	
maxlev_optim	I	100		Maximum grid level where the optimization is	$i_{type_optimize} = 1 \text{ or } 4$
				applied	
beta_spring	R	0.90		tuning factor for target grid length	$i\_type\_optimize = 4$

Defined and used in: src/grid generator/mo io grid.f90

#### 2.1.4 plane options (NAMELIST GRID)

Parameter	Type	Default	Unit	Description	Scope
tria arc km	R	10.0	km	length of triangle edge on plane	lplane=.TRUE.

The number of grid points is generated by root level section and further bisections. The double periodic root level consists of 8 triangles. The spatial coordinates are -1 <= x <= 1, and  $-\sqrt{3}/2 <= y <= \sqrt{3}/2$ . Currently the planar option can only be used as an f-plane. Defined and used in:  $src/grid\_generator/mo\_io\_grid.f90$ 

#### 2.1.5 gridref\_ini (NAMELIST\_GRIDREF)

Parameter Type Default U	it Description	Scope	
--------------------------	----------------	-------	--

Parameter	Type	Default	Unit	Description	Scope
grid_root	Ι	2		root subdivision of initial edges	
start_lev	Ι	4		number of edge bisections following the root	
				subdivision	
n_dom	Ι	2		number of logical model domains, including the	
				global one	
n_phys_dom	Ι	n_dom		number of physical model domains, may be larger	
				than n_dom (in this case, domain merging is	
				applied)	
parent_id	I(n_phys_	i		ID of parent domain (first entry refers to first	
	dom-1)			nested domain; needs to be specified only in case of	
				more than one nested domain per grid level)	
logical_id	I(n_phys_	i+1		logical grid ID of parent domain (first entry refers	
	dom-1)			to first nested domain; needs to be specified only in	
				case of domain merging, i.e. $n_{dom} <$	
				n_phys_dom)	
l_plot	L	.FALSE.		produces GMT plots showing the locations of the	
				nested domains	
l_circ	L	.TRUE.		Create circular (.T.) or rectangular (.F.) refined	
				domains	
l_rotate	${ m L}$	.FALSE.		Rotates center point into the equator in case of	lcirc=.FALSE.
				$l\_circ = .FALSE.$	
write_hierarchy	I	1		0: Output only computational grids	
				1: Output in addition parent grid of global model	
				domain (required for computing physics on a	
				reduced grid)	
				2: Output all grids back to level 0 (required for	
				hierarchical search algorithms)	
bdy_indexing_depth	ı I	$\max_{\text{rlcell}}$		Number of cell rows along the lateral boundary of a	
		(=8)		model domain for which the refin_ctrl fields	
				contain the distance from the lateral boundary;	
				needs to be enlarged when lateral boundary	
				nudging is required for one-way nesting	

Parameter	Type	Default	Unit	Description	Scope
radius	R(n_dom-	30.	deg	radius of nested domain (first entry refers to first	lcirc=.TRUE.
	1)			nested domain; needs to be specified for each nested	
				domain separately)	
hwidth_lon	R(n_dom-	20.	deg	zonal half-width of refined domain (first entry refers	lcirc=.FALSE.
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	
hwidth_lat	R(n_dom-	20.	deg	meridional half-width of refined domain (first entry	lcirc=.FALSE.
	1)			refers to first nested domain; needs to be specified	
				for each nested domain separately)	
center_lon	R(n_dom-	90.	deg	center longitude of refined domain (first entry refers	
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	
center_lat	R(n_dom-	30.	deg	center latitude of refined domain (first entry refers	
	1)			to first nested domain; needs to be specified for	
				each nested domain separately)	

Defined and used in: src/grid\_generator/mo\_gridrefinement.f90

### $2.2 \quad \text{Namelist parameters defining the ocean grid (NAMELIST\_OCEAN\_GRID)}$

The ocean grids are created by the script run/create\_ocen\_grid.run

### ${\bf 2.2.1 \quad grid\_geometry\_conditions}$

Parameter	Type	Default	Unit	Description	Scope
no_of_conditions	I	0		Number of geometric conditions	
patch_shape	I(no_of_co	n@litions)		1=rectangle; 2=circle	
patch_center_x	R(no_of_o	onditions)	degrees	longitude of patch center	
patch_center_y	R(no_of_o	onditions)	degrees	latitude of patch center	
rectangle_xradious	R(no_of_o	onditions)		half meridional extension of a rectangular patch	patch_shape=1
rectangle_yradious	R(no_of_o	onditions)	degrees	half zonal extension of a rectangular patch	$patch\_shape=1$
circle_radious	R(no_of_o	onditions)	degrees	radius of a circular patch	$patch\_shape=2$

Defined in mo\_grid\_conditions.f90

### ${\bf 2.2.2}\quad {\bf create\_ocean\_grid}$

Parameter	Type	Default	Unit	Description	Scope
only_get_sea_land	rhask	.false.		.true.:returns the whole grid with a sea-land mask;	
				.false.:returns only the ocean grid	
smooth_ocean_bour	ıdary	.true.		.true.:smooths the ocean boundaries so no triabgle	
				has two boundary edges; .false.:no smoothing	
input_file	С			name of the input grid file	
elevation_file	С			name of the file containing cell elevation values for	no_of_conditions=0
				the input_file	
elevation_field	С			name of the field containing the cell elevation values	$no\_of\_conditions=0$
min_sea_depth	R	0.0	m	if cell elevation < min_sea_depth then the cell is	
			(nega-	consider sea	
			tive)		
set_sea_depth	R	0.0	m	if not 0, then sea cells are of set_sea_depth	
			(nega-	elevation	
			tive)		
set_min_sea_depth	R	0.0	m	if not 0, then sea cells have a maximum of	
			(nega-	set_min_sea_depth elevation	
			tive)		
edge_elev_interp_n	nethod	2		compute edge elevation from cells using: linear	
				interpolation=1; min value = 2	
output_refined_oce	n <u>C</u> file			name of the output refined ocean grid file	

Defined in mo\_create\_ocean\_grid.f90

### ${\bf 2.3}\quad {\bf Namelist\ parameters\ defining\ the\ torus\ grid\ (NAMELIST\_TORUS\_GRID)}$

#### 2.3.1 torus grid parameters

Parameter	Type	Default	Unit	Description	Scope
y_no_of_rows	I		4	number of triangle rows of the torus grid	
x_no_of_columns	I		8	number of triangle columns of the torus grid	
edge_length	R	m	1000.0	the triangle edge length	
x_center	R	m	0.0	the x coordinate of the torus center	
y_center	R	m	0.0	the y coordinate of the torus center	
out_file_name	С			the torus grid file name	
unfolded_torus_file	n <b>G</b> ame			the unfolded torus grid file name (for plotting)	
ascii_filename	С			the unfolded torus grid ascci file name (for plotting)	

Defined in mo\_create\_torus\_grid.f90. See the run script run/create\_torus\_grid.run.

## 3 Namelist parameters defining the ICON model

Namelist parameters for the ICON models are organized in several thematic Fortran namelists controling the experiment, and the properties of dynamics, transport, physics etc.

### $3.1 \quad master\_nml$

Parameter	Type	Default	Unit	Description	Scope
l_atmo_active	L	.FALSE.		If .TRUE., the atmosphere model is started.	
atmo_name	С			character string to identify the atmosphere	
				component.	
atmo_namelist_filer	a <b>f</b> de			namelist containing the atmospere namelists .	
atmo_min_rank	I	0		Start MPI rank for the atmosphere.	
atmo_max_rank	I	-1		End MPI rank for the atmosphere.	
atmo_inc_rank	I	0		stride of MPI ranks.	
atmo_restart_info_	fil <b>©</b> name	restart.info		Name (including full path) of the restart info file for	
				the atm model	
l_ocean_active	L	.FALSE.		If .TRUE., the ocean model is started.	
ocean_name	С			character string to identify the ocean component.	
ocean_namelist_file	naGhe			namelist containing the ocean namelists .	

Parameter	Type	Default	Unit	Description	Scope
ocean_min_rank	I	0		Start MPI rank for the ocean.	
ocean_max_rank	I	-1		End MPI rank for the ocean.	
ocean_inc_rank	I	0		stride of MPI ranks.	
ocean_restart_info_	fi <b>©</b> name	restart.info		Name (including full path) of the restart info file for	
				the atm model	
l_restart	L	.FALSE.		If .TRUE.: Current experiment is started form a	
				restart.	

## $3.2 \quad time\_nml$

Parameter	Type	Default	Unit	Description	Scope
dt_restart	R	86400.*30.	s	Length of restart cycle in seconds	
calendar	I	1		Calendar type:	
				0=Julian/Gregorian	
				1=proleptic Gregorian	
				$2=30  ext{day/month}, 360  ext{day/year}$	
ini_datatime_string	С	'2008-09-		Initial date and time of the simulation	
		01T00:00:0	ρ <b>Z</b> '		
end_datatime_string	g C	2008-09-		End date and time of the simulation	
		01T01:40:0	DΖ'		
				Length of the run	
				If "nsteps" in run_nml (see below) is positive, then	
				nsteps*dtime is used to compute the end date and	
				time of the run.	
				Else the initial date and time, the end date and	
				time, dt_restart, as well as the time step are used	
				to compute "nsteps".	

## $3.3 \quad parallel\_nml$

Parameter	Type	Default	Unit	Description	Scope
-----------	------	---------	------	-------------	-------

Parameter	Type	Default	Unit	Description	Scope
nproma	I	1		chunk length	
n_ghost_rows	I	1		number of halo cell rows	
division_method	I	1		method of domain decomposition	
				0: read in from file	
				1: use built-in geometric subdivision	
				2: use METIS	
p_test_run	L	.FALSE.		.TRUE. means verification run for MPI	
				parallelization (PE 0 processes full domain)	
l_test_openmp	L	.FALSE.		if .TRUE. is combined with p_test_run=.TRUE.	
				and OpenMP parallelization, the test PE gets only	
				1 thread in order to verify the OpenMP	
				paralllelization	
l_log_checks	L	.FALSE.		if .TRUE. messages are generated during each	
				synchonization step (use for debugging only)	
l_fast_sum	L	.FALSE.		if .TRUE., use fast (not	
				processor-configuration-invariant) global summation	
iorder_sendrecv	I	1		Sequence of send/receive calls: $1 = \text{irecv/send}$ ; $2 =$	
				isend/recv; 3 = isend/irecv	
itype_comm	I	1		1: use local memory for exchange buffers	
				2: use global memory for exchange buffers	
				3: asynchronous halo communication for dynamical	
				core (NH tria only)	
num_io_procs	I	0		Number of I/O processors (running exclusively for	
				${\rm doing}\;{\rm I/O})$	
pio_type	I	1		Type of parallel I/O. Only used if number of I/O	
				processors greater number of domains.	
				Experimental!	

Defined and used in:  $src/namelists/mo\_parallel\_nml.f90$ 

## 3.4 coupling\_nml

Parameter	Type	Default	Unit	Description	Scope
name	С	blank		short name of the coupling field	
frequency	I	0	s	coupling frequency	
time_step	I	0	s	model time step	
lag	I	0		offset to coupling event in number of model time	
				step	
l_time_average	L	.FALSE.		.TRUE.: time averaging between to coupling events	
l_time_accumulation	n L	.FALSE.		.TRUE.: accumulation of coupling fields in time	
				between to coupling events	

Defined and used in: src/namelists/mo\_coupling\_nml.f90

# $3.5 \quad run\_nml$

Parameter	Type	Default	Unit	Description	Scope
ldump_states	L	.FALSE.		Dump patch/interpolation/grid refinement state of	
				every patch (after subdivision in case of a parallel	
				run) to a Netcdf file and exit program.	
lrestore_states	L	.FALSE.		Restore patch/interpolation/grid refinement states	
				from NetCDF dump files instead of calculating	
				them.	
nsteps	I	0		number of time steps of this run.	
dtime	R	600.0	s	time step	
ltestcase	L	.TRUE.		Idealized testcase runs	
ldynamics	L	.TRUE.		Compute adiabatic dynamic tendencies	

Parameter	Type	Default	Unit	Description	Scope
iforcing	I	0		Forcing of dynamics and transport by	
				parameterized processes. Use positive indices for	
				the atmosphere and negative indices for the ocean.	
				0: no forcing	
				1: Held-Suarez forcing	
				2: ECHAM forcing	
				3: NWP forcing	
				4: local diabatic forcing without physics	
				5: local diabatic forcing with physics	
				-1: MPIOM forcing (to be done)	
ltransport	L	.FALSE.		Compute large-scale tracer transport	
ntracer	I	0		Number of advected tracers handled by the	
				large-scale transport scheme	
lvert nest	L	.FALSE.		If set to .true. vertical nesting is switched on (i.e.	
				variable number of vertical levels)	
num_nlev	I(max_dor	n)31		Number of full levels (atm.) for each domain	lvert_nest=.TRUE.
nshift	I(max dor	n)0		vertical half level of parent domain which coincides	lvert nest=.TRUE.
	` _			with upper boundary of the current domain	_
ltimer	L	.TRUE.		TRUE: Timer for monitoring thr runtime of specific	
				routines is on $(FALSE = off)$	
timers_level	I	1			
msg_level	I	10		controls how much printout is written during	
				runtime.	
				For values less than 5, only the time step is written.	

Defined and used in:  $src/namelists/mo\_run\_nml.f90$ 

# $3.6 \quad \mathrm{grid\_nml}$

Parameter	Type	Default	Unit	Description	Scope

Parameter	Type	Default	Unit	Description	Scope
cell type	I	3		Cell type	
				3: triangular cells	
				4: quadrilateral cells (to be done)	
				6: pentagonal/hexagonal cells	
lplane	L	.FALSE.		planar option	
corio_lat	R	0.0	deg	Center of the f-plane is located at this geographical	lplane=.TRUE.
_				latitude	_
l_limited_area	L	.FALSE.			
lfeedback	L(n_dom)	.TRUE.		Specifies if feedback to parent grid is performed.	n_dom>1
				Setting lfeedback(1)=.false. turns off feedback for	
				all nested domains; to turn off feedback for selected	
				nested domains, set lfeedback(1)=.true. and set	
				".false." for the desired model domains	
patch_weight	R(n_dom)	0.		If patch_weight is set to a value > 0 for any of the	n_dom>1
				first level child patches, processor splitting will be	
				performed, i.e. every of the first level child patches	
				gets a subset of the total number or processors	
				corresponding to its patch_weight. A value of 0.	
				corresponds to exactly 1 processor for this patch,	
				regardless of the total number of processors. For the	
				root patch and higher level childs, patch_weight is	
				not used. However, patch_weight must be set to 0	
				for these patches to avoid confusion.	
lredgrid_phys	L	.FALSE.		If set to .true. is calculated on a reduced grid (=	
				one grid level higher); requires lpatch0=.TRUE.	
dynamics_grid_	C			Array of the grid filenames to be used by the	
filename				dycore.	
dynamics_parent_	I			Array of the indexes of the parent grid filenames, as	
grid_id				described by the dynamics_grid_filename array.	
				Indexes start at 1, an index of 0 indicates no parent.	
radiation_grid_	С			Array of the grid filenames to be used for the	
filename				radiation model. Filled only if the radiation grid is	
				different from the dycore grid.	

Parameter	Type	Default	Unit	Description	Scope
dynamics_radiation	I			Array of the indexes linking the dycore grids, as	
_grid_link				described by the dynamics_grid_filename array,	
				and the radiation_grid_filename array. It provides	
				the link index of the radiation grid filename, for	
				each entry of the dynamics_grid_filename array.	
				Indexes start at 1, an index of 0 indicates that the	
				radiation grid is the same as the dycore grid. Only	
				needs to be filled when the	
				radiation_grid_filename is defined.	

Defined and used in: src/namelists/mo\_grid\_nml.f90

# $3.7 \quad \text{gridref\_nml}$

Parameter	Type	Default	Unit	Description	Scope
$grf\_intmethod\_c$	I	2		Interpolation method for grid refinement (cell-based	n_dom>1
				dynamical variables):	
				1: parent-to-child copying	
				2: gradient-based interpolation	
$grf\_intmethod\_ct$	I	2		Interpolation method for grid refinement (cell-based	n_dom>1
				tracer variables):	
				1: parent-to-child copying	
				2: gradient-based interpolation	
$grf\_intmethod\_e$	I	4		Interpolation method for grid refinement	$n_{dom}>1$
				(edge-based variables):	
				1: inverse-distance weighting (IDW)	
				2: RBF interpolation	
				3: combination gradient-based / IDW	
				4: combination gradient-based / RBF	
grf_velfbk	I	1		Method of velocity feedback:	n_dom>1
				1: average of child edges 1 and 2	
				2: 2nd-order method using RBF interpolation	

Parameter	Type	Default	Unit	Description	Scope
grf_scalfbk	Ι	2		Feedback method for dynamical scalar variables	n_dom>1
				$(T, p_{sfc})$ :	
				1: area-weighted averaging	
				2: bilinear interpolation	
grf_tracfbk	I	2		Feedback method for tracer variables:	$n\_dom > 1$
				1: area-weighted averaging	
				2: bilinear interpolation	
grf_idw_exp_e12	R	1.2		exponent of generalized IDW function for child	n_dom>1
				edges $1/2$	
grf_idw_exp_e34	R	1.7		exponent of generalized IDW function for child	n_dom>1
				edges $3/4$	
rbf_vec_kern_grf_e	I	1		RBF kernel for grid refinement (edges):	n_dom>1
				1: Gaussian	
				$2: 1/(1+r^2)$	
				3: inverse multiquadric	
rbf_scale_grf_e	R	0.5		RBF scale factor for grid refinement (edges)	n_dom>1
denom_diffu_t	R	135		Deniminator for lateral boundary diffusion of	n_dom>1
				temperature	
denom_diffu_v	R	200		Deniminator for lateral boundary diffusion of	n_dom>1
				velocity	

Defined and used in: src/namelists/mo\_gridref\_nml.f90

# $3.8 \quad interpol\_nml$

Parameter	Type	Default	Unit	Description	Scope
llsq_high_consv	L	.TRUE.		conservative (T) or non-conservative (F)	
				least-squares reconstruction for high order transport	
lsq_high_ord	I	3		polynomial order for high order reconstruction	
				2: quadratic	
				30: cubic (no $3^{rd}$ order cross deriv.)	
				3: cubic	

Parameter	Type	Default	Unit	Description	Scope
rbf_vec_kern_c	I	1		Kernel type for reconstruction at cell centres:	
				1: Gaussian	
				3: inverse multiquadric	
rbf vec kern e	I	3		Kernel type for reconstruction at edges:	
				1: Gaussian	
				3: inverse multiquadric	
rbf vec kern v	I	1		Kernel type for reconstruction at vertices:	
				1: Gaussian	
				3: inverse multiquadric	
rbf vec scale c	R(n dom)	resolution-		Scale factor for RBF reconstruction at cell centres	
	\ _ /	dependent			
rbf vec scale e	R(n dom)	resolution-		Scale factor for RBF reconstruction at edges	
	\ _ /	dependent			
rbf_vec_scale_v	R(n dom)	resolution-		Scale factor for RBF reconstruction at vertices	
	\ _ /	dependent			
nudge_max_coeff	R	0.02		Maximum relaxation coefficient for lateral	
				boundary nudging	
nudge efold width	R	2.5		e-folding width (in units of cell rows) for lateral	
				boundary nudging coefficient	
nudge_zone_width	I	8		Total width (in units of cell rows) for lateral	
				boundary nudging zone	
i_cori_method	I	3		Selector for tangential wind reconstruction method	currently only for
					$cell\_type=6$
				1: Almut's method for tangential wind, but PV	
				usage as in TRSK	
				2: method of Thuburn, Ringler, Skamarock and	
				Klemp (TRSK)	
				3: Almut's method for tangential wind and PV	
				usage	
l_corner_vort	L	.TRUE.		switch whether the rhombus averaged corner	$i\_cori\_method=3$
				vorticity is averaged to the hexagon (.TRUE.) or	
				the rhombi are directly averaged to the hexagon	
				(.FALSE.)	

Defined and used in: src/namelists/mo interpol nml.f90

### 3.9 dynamics nml

This namelist is relevant if run\_nml:ldynamics=.TRUE.

Parameter	Type	Default	Unit	Description	Scope
iequations	I	1		Equations and prognostic variables. Use positive	
				indices for the atmosphere and negative indices for	
				the ocean.	
				0: shallow water model	
				1: hydrostatic atmosphere, T	
				2: hydrostatic atm., $\theta$ -dp	
				3: non-hydrostatic atmosphere	
				-1: hydrostatic ocean	
idiv_method	I	1		Method for divergence computation:	grid_nml:cell_type=3
				1: Standard Gaussian integral. Hydrostatic	
				atm. model: for unaveraged normal components,	
				Non-hydrostatic atm. model: for averaged normal	
				components	
				2: bilinear averaging of divergence	
divavg_cntrwgt	R	0.5		Weight of central cell for divergence averaging	$idiv\_method=2$
sw_ref_height	R	0.9*2.94e4/	gm	Reference height of shallow water model used for	
				linearization in the semi-implicit time stepping	
				scheme	
lcoriolis	L	.TRUE.		Coriolis force	

Defined and used in: src/namelists/mo\_dynamics\_nml.f90

## $3.10 \quad ha\_dyn\_nml$

This namelist is relevant if run\_nml:ldynamics=.TRUE. and dynamics\_nml:iequations=IHS\_ATM\_TEMP or IHS\_ATM\_THETA.

Parameter Type Default Unit Description	Scope
---	-------

Parameter	Type	Default	Unit	Description	Scope
itime_scheme	I	4		Time integration scheme:	
				11: pure advection (no dynamics)	
				12: 2 time level semi implicit (not yet implemented)	
				13: 3 time level explicit	
				14: 3 time level with semi implicit correction	
				15: standard 4th-order Runge-Kutta method	
				(4-stage)	
				16: $SSPRK(5,4)$ scheme (5-stage)	
ileapfrog_startup	I	1		How to integrate the first time step when the	itime_scheme= 13 or 14
				leapfrog scheme is chosen. $1 = \text{Euler forward}$ ; $2 = a$	
				series of sub-steps.	
asselin_coeff	R	0.1		Asselin filter coefficient	$itime\_scheme = 13 \text{ or } 14$
si_2tls	R	0.6		weight of time step $n+1$ . Valid range: $[0,1]$	$itime\_scheme=12$
si_expl_scheme	I	2		scheme for the explicit part used in the 2 time level	$itime\_scheme=12$
				semi-implicit time stepping scheme. $1 = \text{Euler}$	
				forward; $2 = Adams$ -Bashforth 2nd order	
si_cmin	R	30.0	m/s	semi implicit correction is done for eigenmodes with	itime_scheme=14 and
				speeds larger than si_cmin	$lsi_3d=.FALSE.$
si_coeff	R	1.0		weight of the semi implicit correction	itime_scheme=14
si_offctr	R	0.7			itime_scheme=14
si_rtol	R	1.0e-3		relative tolerance for GMRES solver	itime_scheme=14
lsi_3d	L	.FALSE.		3D GMRES solver or decomposistion into 2D	lshallow_water=.FALSE.
				problems	and itime_scheme=14
ldry_dycore	L	.TRUE.		Assume dry atmosphere	iequations $\in \{1,2\}$
lref_temp	L	.FALSE.		Set a background temperature profile as base state	iequations $\in \{1,2\}$
				when computing the pressure graident force

decay_scale_2	R	2500	m	Decay scale of small-scale topography component	
decay_exp	R	1.2		Exponent of decay function	
flat_height	R	16000	m	Height above which the coordinate surfaces are flat	

Defined and used in: src/namelists/mo\_sleve\_nml.f90

## $3.13 \quad diffusion\_nml$

Parameter	Type	Default	Unit	Description	Scope
lhdiff_temp	L	.TRUE.		Diffusion on the temperature field	
lhdiff_vn	L	.TRUE.		Diffusion on the horizontal wind field	
hdiff_order	I	4		Order of $\nabla$ operator for diffusion:	
				-1: no diffusion	
				2: $\nabla^2$ diffusion	
				3: Smagorinsky $\nabla^2$ diffusion for the hexagonal	
				model (includes frictional heating if	
				lhdiff_temp=.TRUE.)	
				4: $\nabla^4$ diffusion	

Parameter	Type	Default	Unit	Description	Scope
				5: Smagorinsky $\nabla^2$ diffusion combined with $\nabla^4$	
				background diffusion as specified via	
				hdiff efdt ratio	
				defaults: 2 for hexagonal model, 4 for triangular model	
				24 or 42: $\nabla$ 2 diffusion from model top to a certain	24 and 42 currently
				level (cf. k2_pres_max and k2_klev_max below);	allowed only in the
				$\nabla^4$ for the lower levels.	hydrostatic atm model
					$(run\_nml:iequation = 1)$
					or 2).
k2_pres_max	R	-99.	Pa	Pressure level above which $\nabla^2$ diffusion is applied.	$hdiff_order = 24 \text{ or } 42,$
					and $run_nml$ : iequation =
					1 or 2.
k2_klev_max	I	0		Index of the vertical level till which (from the model	$hdiff\_order = 24 \text{ or } 42,$
				top) $\nabla^2$ diffusion is applied. If a positive value is	and $run_nml$ : $iequation =$
				specified for k2_pres_max, k2_klev_max is reset	1 or 2.
				accordingly during the initialization of a model run.	
hdiff_efdt_ratio	R	1.0		ratio of e-folding time to time step (or 2* time step	
				when using a 3 time level time stepping scheme)	
				(only for triangles currently)	
hdiff_min_efdt_ra	tioR	1.0		minimum value of hdiff_efdt_ratio near model top	iequations=3 .AND.
					cell_type=3
hdiff_tv_ratio	R	1.0		Ratio of diffusion coefficients for temperature and	
				normal wind: $T: v_n$	
hdiff_multfac	R	1.0		Multiplication factor of normalized diffusion	$n_{dom}>1$
				coefficient for nested domains	
hdiff_smag_fac	R	0.15		Scaling factor for Smagorinsky diffusion	for triangles only with
					iequations=3, for
					hexagons with
					hdiff_order=3

## 4 Namelist parameters for testcases (NAMELIST\_ICON)

The ICON model code includes several experiments, so-called test cases, for the shallow water model as well as the 3-dimensional atmosphere. Depending on the specified experiment, initial conditions and boundary conditions are computed internally.

### 6 Information on vertical level distribution

The hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coorindates. The hybrid level specification is stored in <icon home>/hyb\_params/HYB\_PARAMS\_<nlev>. The hydrostatic model assumes to get pressure based coordinates, the nonhydrostatic model expects height based coordinates. For further information see <icon home>/hyb\_params/README.
