1 ICON Namelists

1.1 Scripts, Namelist files and Programs

Run scripts starting the programs for the grid generation and the models are stored in run/. These scripts write namelist files containing the specified Fortran namelists. Programs are stored in <icon home>/build/<architecture>/bin/.

Table 1: Namelist files

| Namelist file | Purpose | Made by script | Used by program |
|---------------------|---------------------|-----------------------------|--|
| NAMELIST_GRAPH | Generate graphs | create_global_grids.run | grid_command |
| $NAMELIST_GRID$ | Generate grids | $create_global_grids.run$ | $\operatorname{grid} _\operatorname{command}$ |
| $NAMELIST_GRIDREF$ | Gen. nested domains | $create_global_grids.run$ | $\operatorname{grid} _\operatorname{command}$ |
| NAMELIST OCEAN GRID | Gen. ocean grid | create ocean grid.run | grid command |
| NAMELIST TORUS GRID | Gen. torus grid | create torus grid.run | grid command |
| NAMELIST_ICON | Run ICON models | \exp $<$ $name > .run$ | $\frac{1}{1}$ control_model |

1.2 Namelist parameters

The following subsections tabulate all available Fortran namelist parameters by name, type, default value, unit, description, and scope:

- Type refers to the type of the Fortran variable, in which the value is stored: I=INTEGER, L=LOGICAL, R=REAL, C=character string
- ullet Default is the preset value, if defined, that is assigned to this parameter within the programs.
- *Unit* shows the unit of the control parameter, where applicable.
- \bullet Description explains in a few words the purpose of the parameter.
- Scope explains under which conditions the namelist parameter has any effect, if its scope is restricted to specific settings of other namelist parameters.

Information on the file, where the namelist is defined and used, is given at the end of each table.

2 Namelist parameters for grid generation

2.1 Namelist parameters defining the atmosphere grid

2.1.1 graph_ini (NAMELIST_GRAPH)

| Parameter | Type | Default | Unit | Description | Scope |
|-------------|------|---------|------|--|-------|
| nroot | I | 2 | | root subdivision of initial edges | |
| grid_levels | I | 4 | | number of edge bisections following the root | |
| | | | | subdivision | |
| lplane | L | .FALSE. | | switch for generating a double periodic planar grid. | |
| | | | | The root level consists of 8 triangles. | |

Defined and used in: src/grid_generator/mo_io_graph.f90

2.1.2 grid_ini (NAMELIST_GRID)

| Parameter | Type | Default | Unit | Description | Scope |
|-------------|------|---------|------|---|-------|
| nroot | I | 2 | | root subdivision of initial edges | |
| grid_levels | I | 4 | | number of edge bisections following the root | |
| | | | | subdivision | |
| lplane | L | .FALSE. | | switch for generating planar grid. The root level | |
| | | | | consists of 8 triangles. | |

Defined and used in: $src/grid_generator/mo_io_grid.f90$

2.1.3 grid_options (NAMELIST_GRID)

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------|---------|------|--|-------|
| x_{rot}_{angle} | R | 0.0 | deg | Rotation of the icosahedron about the x-axis | |
| | | | | (connecting the origin and [0°E, 0°N]) | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------|------|---------|------|--|--|
| y_rot_angle | R | 0.0 | deg | Rotation of the icosahedron about the y-axis | |
| | | | | (connecting the origin and [90°E, 0°N), done after | |
| | | | | the rotation about the x-axis. | |
| z_rot_angle | R | 0.0 | deg | rotation of the icosahedron about the z-axis | |
| | | | | (connecting the origin and [0°E, 90°N), done after | |
| | | | | the rotation about the y-axis. | |
| itype_optimize | I | 4 | | Grid optimization type | |
| | | | | 0: no optimization | |
| | | | | 1: Heikes Randall | |
| | | | | 2: equal area | |
| | | | | 3: c-grid small circle | |
| | | | | 4: spring dynamics | |
| l_c_grid | L | .FALSE. | | C-grid constraint on last level | |
| maxlev_optim | I | 100 | | Maximum grid level where the optimization is | $i_{type_optimize} = 1 \text{ or } 4$ |
| | | | | applied | |
| beta_spring | R | 0.90 | | tuning factor for target grid length | $i_{type_optimize} = 4$ |

Defined and used in: src/grid generator/mo io grid.f90

2.1.4 plane options (NAMELIST GRID)

| Parameter | Type | Default | Unit | Description | Scope |
|-------------|------|---------|------|----------------------------------|-----------------|
| tria_arc_km | R | 10.0 | km | length of triangle edge on plane | lplane = .TRUE. |

The number of grid points is generated by root level section and further bisections. The double periodic root level consists of 8 triangles. The spatial coordinates are -1 <= x <= 1, and $-\sqrt{3}/2 <= y <= \sqrt{3}/2$. Currently the planar option can only be used as an f-plane. Defined and used in: $\text{src/grid_generator/mo_io_grid.f90}$

2.1.5 gridref ini (NAMELIST GRIDREF)

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|-----------------------|-------------|-------|

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------------|---------------|------------|------|--|---------------|
| grid_root | I | 2 | | root subdivision of initial edges | |
| start_lev | I | 4 | | number of edge bisections following the root | |
| | | | | subdivision | |
| $n_{ m dom}$ | I | 2 | | number of logical model domains, including the | |
| | | | | global one | |
| n_phys_dom | I | n_dom | | number of physical model domains, may be larger | |
| | | | | than n_dom (in this case, domain merging is | |
| | | | | applied) | |
| $\operatorname{parent_id}$ | I(n_phys_ | i | | ID of parent domain (first entry refers to first | |
| | dom-1) | | | nested domain; needs to be specified only in case of | |
| | | | | more than one nested domain per grid level) | |
| logical_id | I(n_phys_ | i+1 | | logical grid ID of domain (first entry refers to first | |
| | dom-1) | | | nested domain; needs to be specified only in case of | |
| | | | | domain merging, i.e. n_dom < n_phys_dom) | |
| l_plot | $\mid L \mid$ | .FALSE. | | produces GMT plots showing the locations of the | |
| | | | | nested domains | |
| $l_{\rm circ}$ | $\mid L \mid$ | .TRUE. | | Create circular (.T.) or rectangular (.F.) refined | |
| | | | | domains | |
| l_rotate | $\mid L$ | .FALSE. | | Rotates center point into the equator in case of | lcirc=.FALSE. |
| | | | | l_circ = .FALSE. | |
| write_hierarchy | I | 1 | | 0: Output only computational grids | |
| | | | | 1: Output in addition parent grid of global model | |
| | | | | domain (required for computing physics on a | |
| | | | | reduced grid) | |
| | | | | 2: Output all grids back to level 0 (required for | |
| | | , , | | hierarchical search algorithms) | |
| bdy_indexing_depth | I | max_rlcell | l | Number of cell rows along the lateral boundary of a | |
| | | (=8) | | model domain for which the refin_ctrl fields | |
| | | | | contain the distance from the lateral boundary; | |
| | | | | needs to be enlarged when lateral boundary | |
| | | | | nudging is required for one-way nesting | |

| Parameter | Type | Default | Unit | Description | Scope |
|------------|----------|---------|------|--|---------------|
| radius | R(n_dom- | 30. | deg | radius of nested domain (first entry refers to first | lcirc=.TRUE. |
| | 1) | | | nested domain; needs to be specified for each nested | |
| | | | | domain separately) | |
| hwidth_lon | R(n_dom- | 20. | deg | zonal half-width of refined domain (first entry refers | lcirc=.FALSE. |
| | 1) | | | to first nested domain; needs to be specified for | |
| | | | | each nested domain separately) | |
| hwidth_lat | R(n_dom- | 20. | deg | meridional half-width of refined domain (first entry | lcirc=.FALSE. |
| | 1) | | | refers to first nested domain; needs to be specified | |
| | | | | for each nested domain separately) | |
| center_lon | R(n_dom- | 90. | deg | center longitude of refined domain (first entry refers | |
| | 1) | | | to first nested domain; needs to be specified for | |
| | | | | each nested domain separately) | |
| center_lat | R(n_dom- | 30. | deg | center latitude of refined domain (first entry refers | |
| | 1) | | | to first nested domain; needs to be specified for | |
| | | | | each nested domain separately) | |

Defined and used in: $src/grid_generator/mo_gridrefinement.f90$

${\bf 2.1.6 \quad gridref_metadata\ (NAMELIST_GRIDREF)}$

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------------|-------------|---------|------|--|-------|
| number_of_grid_used | $I(n_dom+$ | 1)0 | | sets the number of grid used in the netcdf header; | |
| | | | | the number of entries must be n_dom+1 because | |
| | | | | the first number refers to the radiation grid | |
| centre | I | 0 | | centre running the grid generator: 78 - edzw | |
| | | | | (DWD), 252 - MPIM | |
| $\operatorname{subcentre}$ | I | 0 | | subcentre to be assigned by centre, usually 0 | |
| $outname_style$ | I | 1 | | Output name style | |
| | | | | 1: Standard: $iconRXBXX_DOMXX.nc$ | |
| | | | | 2: DWD: $icon_grid_XXXX_RXXBXX_X.nc$ | |

2.2 Namelist parameters defining the local grid generation

The ocean grids are created by the script run/create_ocen_grid.run

${\bf 2.2.1 \quad grid_geometry_conditions}$

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|------------|---------|---------|--|------------------|
| $no_of_conditions$ | I | 0 | | Number of geometric conditions | |
| patch_shape | I(no_of_ | 0 | | 1=rectangle; 2=circle | |
| | condi- | | | | |
| | tions) | | | | |
| patch_center_x | $R(no_of$ | 0.0 | degrees | longitude of patch center | |
| | _ condi- | | | | |
| | tions) | | | | |
| patch_center_y | R(no_of | 0.0 | degrees | latitude of patch center | |
| | _ condi- | | | | |
| | tions) | | | | |
| $rectangle_xradious$ | R(no_of_ | 0.0 | degrees | half meridional extension of a rectangular patch | $patch_shape=1$ |
| | condi- | | | | |
| | tions) | | | | |
| rectangle_yradious | R(no_of_ | 0.0 | degrees | half zonal extension of a rectangular patch | $patch_shape=1$ |
| | condi- | | | | |
| | tions) | | | | |
| circle_radious | R(no_of_ | 0.0 | degrees | radius of a circular patch | $patch_shape=2$ |
| | condi- | | | | |
| | tions) | | | | |

Defined in mo_grid_conditions.f90

2.2.2 local grid optimization

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|---------|------|-----------------------------|-------|
| $use_optimization$ | L | .FALSE. | | Apply, or not, optimization | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|------|---------|------|---|-------|
| use_edge_springs | L | .FALSE. | | Use spring dynamics | |
| prime_ref_length _coeff | R | 1.0 | | Spring length coefficient | |
| use_adaptive_ | L | .FALSE. | | Use adaptive spring length | |
| $spring_length$ | | | | | |
| use_local_reference | L | .FALSE. | | Use locally adaptive spring length | |
| _length | | | | | |
| local_reference_ | R | 0.0 | | Coefficient of local vs global spring length | |
| length_coeff | | | | | |
| use_isotropy_force | L | .FALSE. | | Use isotropy force, tends to create symmetric | |
| | | | | triangles | |
| isotropy_rotation _coeff | R | 0.0 | | Coefficient of the rotational isotropy force | |
| isotropy_stretch _coeff | R | 0.0 | | Coefficient of the stretch isotropy force | |
| optimize_vertex _depth | I | 1 | | For patches the min depth of the vertices that will | |
| | | | | be optimized. The boundary vertices have depth 0, | |
| | | | | the next level 1, etc. | |

Defined in mo_local_grid_optimization.f90

2.2.3 create_ocean_grid

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|------|---------|--------|--|--------------------------|
| only_get_sea_ | L | .false. | | .true.:returns the whole grid with a sea-land mask; | |
| $land_mask$ | | | | .false.:returns only the ocean grid | |
| $smooth_ocean_$ | L | .true. | | .true.:smooths the ocean boundaries so no triabgle | |
| boundary | | | | has two boundary edges; .false.:no smoothing | |
| input_file | С | | | name of the input grid file | |
| elevation_file | С | | | name of the file containing cell elevation values for | $no_of_conditions = 0$ |
| | | | | the input_file | |
| elevation_field | С | | | name of the field containing the cell elevation values | $no_of_conditions = 0$ |
| \min_sea_depth | R | 0.0 | m | if cell elevation < min_sea_depth then the cell is | |
| | | | (nega- | consider sea | |
| | | | tive) | | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|---------|--------|---|-------|
| set_sea_depth | R | 0.0 | m | if not 0, then sea cells are of set_sea_depth | |
| | | | (nega- | elevation | |
| | | | tive) | | |
| set_min_sea_depth | R | 0.0 | m | if not 0, then sea cells have a maximum of | |
| | | | (nega- | set_min_sea_depth elevation | |
| | | | tive) | | |
| edge_elev_ | I | 2 | | compute edge elevation from cells using: linear | |
| $interp_method$ | | | | interpolation=1; min value = 2 | |
| $output_refined_$ | С | | | name of the output refined ocean grid file | |
| ocean_file | | | | | |

Defined in mo_create_ocean_grid.f90

2.2.4 torus grid parameters

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------|------|---------|--------|--|-------|
| y_no_of_rows | I | | 4 | number of triangle rows of the torus grid, $>=2$ | |
| $x_{no_of_columns}$ | I | | 8 | number of triangle columns of the torus grid, $>=2$ | |
| $edge_length$ | R | m | 1000.0 | the triangle edge length | |
| x_center | R | m | 0.0 | the x coordinate of the torus center | |
| y_center | R | m | 0.0 | the y coordinate of the torus center | |
| ${ m out_file_name}$ | C | | | the torus grid file name | |
| $unfolded_torus_$ | C | | | the unfolded torus grid file name (for plotting) | |
| file_name | | | | | |
| ascii_filename | C | | | the unfolded torus grid ascci file name (for plotting) | |

Defined in mo_create_torus_grid.f90. See the run script run/create_torus_grid.run.

3 Namelist parameters defining the ICON model

Namelist parameters for the ICON models are organized in several thematic Fortran namelists controling the experiment, and the properties of dynamics, transport, physics etc.

3.1 coupling_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------------|------|---------|------|--|-------|
| name | C | blank | | short name of the coupling field | |
| $dt_coupling$ | I | 0 | s | coupling time step / coupling interval | |
| dt_model | I | 0 | s | model time step | |
| lag | I | 0 | | offset to coupling event in number of model time | |
| | | | | steps | |
| $l_time_average$ | L | .FALSE. | | .TRUE.: time averaging between two coupling | |
| | | | | events | |
| $l_time_accumulation$ | L | .FALSE. | | .TRUE.: accumulation of coupling fields in time | |
| | | | | between two coupling events | |
| $l_diagnostic$ | L | .FALSE. | | .TRUE.: simple diagnostics (min, max, avg) for | |
| | | | | coupling fields is switched on | |
| l_activated | L | .FALSE. | | .TRUE.: activate the coupling of the respective | |
| | | | | coupling field | |

Defined and used in: $src/namelists/mo_coupling_nml.f90$

3.2 diffusion_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-------------|------|-----------|------|--|-------|
| lhdiff_temp | L | .TRUE. | | Diffusion on the temperature field | |
| lhdiff_vn | L | .TRUE. | | Diffusion on the horizontal wind field | |
| lhdiff_w | L | .TRUE. | | Diffusion on the vertical wind field | |
| hdiff_order | I | 4 (hydro) | | Order of ∇ operator for diffusion: | |
| | | 5 (NH) | | | |
| | | | | -1: no diffusion | |
| | | | | 2: ∇^2 diffusion (not available for NH model on | |
| | | | | triangles!) | |
| | | | | 3: Smagorinsky ∇^2 diffusion (includes frictional | |
| | | | | heating for the hexagonal model if | |
| | | | | lhdiff_temp=.TRUE.) | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|------|--------------------------------|------|--|---|
| | | | | 4: ∇ ⁴ diffusion 5: Smagorinsky ∇ ² diffusion combined with ∇ ⁴ background diffusion as specified via hdiff_efdt_ratio defaults: 2 for hexagonal model, 4 for hydrostatic triangular model, 5 for nonhydrostatic triangular NH model 24 or 42: ∇2 diffusion from model top to a certain level (cf. k2_pres_max and k2_klev_max below); ∇ ⁴ for the lower levels. | 24 and 42 currently allowed only in the hydrostatic atm model (run_nml:iequation = 1 or 2). |
| itype_vn_diffu | I | 1 | | Reconstruction method used for Smagorinsky diffusion: 1: u/v reconstruction at vertices only 2: u/v reconstruction at cells and vertices | iequations=3, hdiff_order=3 or 5 |
| itype_t_diffu | I | 2 | | Discretization of temperature diffusion: 1: $K_h \nabla^2 T$ 2: $\nabla \cdot (K_h \nabla T)$ | iequations=3, hdiff_order=3 or 5 |
| k2_pres_max | R | -99. | Pa | Pressure level above which ∇^2 diffusion is applied. | hdiff_order = 24 or 42, and run_nml:iequation = 1 or 2. |
| k2_klev_max | I | 0 | | Index of the vertical level till which (from the model top) ∇^2 diffusion is applied. If a positive value is specified for k2_pres_max, k2_klev_max is reset accordingly during the initialization of a model run. | hdiff_order = 24 or 42, and run_nml:iequation = 1 or 2. |
| hdiff_efdt_ratio | R | 1.0 (hydro) 36.0 (NH) | | ratio of e-folding time to time step (or 2* time step when using a 3 time level time stepping scheme) (only for triangles currently; for triangular NH model, values above 30 are recommended when using hdiff_order=5) | |
| hdiff_w_efdt_ratio | R | 15.0 | | ratio of e-folding time to time step for diffusion on vertical wind speed | iequations=3 |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|------|---------|------|---|-------------------------|
| hdiff_min_efdt_ratio | R | 1.0 | | minimum value of hdiff_efdt_ratio near model top | iequations=3 .AND. |
| | | | | | hdiff_order=4 |
| hdiff_tv_ratio | R | 1.0 | | Ratio of diffusion coefficients for temperature and | |
| | | | | normal wind: $T:v_n$ | |
| hdiff_multfac | R | 1.0 | | Multiplication factor of normalized diffusion | n_dom>1 |
| | | | | coefficient for nested domains | |
| hdiff_smag_fac | R | 0.15 | | Scaling factor for Smagorinsky diffusion | for triangles only with |
| | | (hydro) | | | iequations=3, for |
| | | 0.015 | | | hexagons with |
| | | (NH) | | | hdiff_order=3 |

Defined and used in: $src/namelists/mo_diffusion_nml.f90$

3.3 dynamics_nml

This namelist is relevant if run_nml:ldynamics=.TRUE.

| Parameter | Type | Default | Unit | Description | Scope |
|----------------|------|---------|------|---|--------------------|
| iequations | I | 1 | | Equations and prognostic variables. Use positive | |
| | | | | indices for the atmosphere and negative indices for | |
| | | | | the ocean. | |
| | | | | 0: shallow water model | |
| | | | | 1: hydrostatic atmosphere, T | |
| | | | | 2: hydrostatic atm., θ -dp | |
| | | | | 3: non-hydrostatic atmosphere | |
| | | | | -1: hydrostatic ocean | |
| idiv_method | I | 1 | | Method for divergence computation: | |
| | | | | 1: Standard Gaussian integral. Hydrostatic | |
| | | | | atm. model: for unaveraged normal components, | |
| | | | | Non-hydrostatic atm. model: for averaged normal | |
| | | | | components | |
| | | | | 2: bilinear averaging of divergence | |
| divavg_cntrwgt | R | 0.5 | | Weight of central cell for divergence averaging | $idiv_method = 2$ |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------|------------|------|--|-------|
| sw_ref_height | R | 0.9*2.94e4 | gm | Reference height of shallow water model used for | |
| | | | | linearization in the semi-implicit time stepping | |
| | | | | scheme | |
| lcoriolis | L | .TRUE. | | Coriolis force | |

Defined and used in: $src/namelists/mo_dynamics_nml.f90$

$3.4 \quad echam_conv_nml$

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|---|--|
| iconv | I | 1 | | Choice of cumulus convection scheme. | iforcing = 2 .AND. $lconv$ |
| | | | | 1: Nordeng scheme | = .TRUE. |
| | | | | 2: Tiedtke scheme | |
| | | | | 3: hybrid scheme | |
| nevmicro | I | 0 | | Choice of convective microphysics scheme. | iforcing = 2 .AND. lconv = .TRUE. |
| lmfpen | L | .TRUE. | | Switch on penetrative convection. | iforcing = 2 .AND. lconv = .TRUE. |

3.7 grid_nml

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------------|------|---------|------|--|-------|
| $\operatorname{cell_type}$ | I | 3 | | Cell type | |
| | | | | 3: triangular cells | |
| | | | | 4: quadrilateral cells (not yet available) | |
| lplane | L | .FALSE. | | planar option | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|----------|---------|---------|--|-----------------------|
| is_plane_torus | L | .FALSE. | | f-plane approximation on triangular grid | |
| corio_lat | R | 0.0 | deg | Center of the f-plane is located at this geographical | lplane=.TRUE. and |
| | | | | latitude | is_plane_torus=.TRUE. |
| grid_angular_velocity | R | Earth's | rad/sec | The angular velocity in rad per sec. | |
| l_limited_area | L | .FALSE. | | | |
| grid_rescale_factor | R | 1.0 | | The geometry and the timestep will be multiplied | |
| | | | | by this factor. | |
| | | | | The angular velocity will be divided by this factor. | |
| lfeedback | L(n_dom) | .TRUE. | | Specifies if feedback to parent grid is performed. | n_dom>1 |
| | | | | Setting lfeedback(1)=.false. turns off feedback for | |
| | | | | all nested domains; to turn off feedback for selected | |
| | | | | nested domains, set $lfeedback(1) = .true$. and set | |
| | | | | ".false." for the desired model domains | |
| ifeedback_type | I | 2 | | 1: incremental feedback | n_dom>1 |
| | | | | 2: relaxation-based feedback | |
| | | | | Note: vertical nesting requires option 2 to run | |
| | | | | numerically stable over longer time periods | |
| $start_time$ | R(n_dom) | 0. | S | Time when a nested domain starts to be active | n_dom>1 |
| | | | | (namelist entry is ignored for the global domain) | |
| $\mathrm{end_time}$ | R(n_dom) | 1.E30 | S | Time when a nested domain terminates (namelist | n_dom>1 |
| | | | | entry is ignored for the global domain) | |
| patch_weight | R(n_dom) | 0. | | If patch_weight is set to a value > 0 for any of the | n_dom>1 |
| | | | | first level child patches, processor splitting will be | |
| | | | | performed, i.e. every of the first level child patches | |
| | | | | gets a subset of the total number or processors | |
| | | | | corresponding to its patch_weight. A value of 0. | |
| | | | | corresponds to exactly 1 processor for this patch, | |
| | | | | regardless of the total number of processors. For the | |
| | | | | root patch and higher level childs, patch_weight is | |
| | | | | not used. However, patch_weight must be set to 0 | |
| | | | | for these patches to avoid confusion. | |
| lredgrid_phys | L | .FALSE. | | If set to .true. is calculated on a reduced grid (= | |
| | | | | one grid level higher) | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|------|---------|------|--|-------|
| dynamics_grid_ filename | С | | | Array of the grid filenames to be used by the | |
| | | | | dycore. May contain the keyword <path> which</path> | |
| | | | | will be substituted by model_base_dir. | |
| $dynamics_parent_$ | I | | | Array of the indexes of the parent grid filenames, as | |
| grid_id | | | | described by the dynamics_grid_filename array. | |
| | | | | Indexes start at 1, an index of 0 indicates no parent. | |
| radiation_grid_ filename | C | | | Array of the grid filenames to be used for the | |
| | | | | radiation model. Filled only if the radiation grid is | |
| | | | | different from the dycore grid. May contain the | |
| | | | | keyword <path> which will be substituted by</path> | |
| | | | | model_base_dir. | |
| dynamics_radiation | I | | | Array of the indexes linking the dycore grids, as | |
| _grid_link | | | | described by the dynamics_grid_filename array, | |
| | | | | and the radiation_grid_filename array. It provides | |
| | | | | the link index of the radiation_grid_filename, for | |
| | | | | each entry of the dynamics_grid_filename array. | |
| | | | | Indexes start at 1, an index of 0 indicates that the | |
| | | | | radiation grid is the same as the dycore grid. Only | |
| | | | | needs to be filled when the | |
| | | | | radiation_grid_filename is defined. | |

Defined and used in: $src/namelists/mo_nh_pzlev_nml.f90$

$3.22 \quad nonhydrostatic_nml \; (relevant \; if \; run_nml:iequations{=}3)$

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|---------|------|---|-------|
| itime_scheme | I | 4 | | Options for predictor-corrector time-stepping | |
| | | | | scheme: | |

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------------------|----------|---------|------|---|-------------------------|
| | | | | 4: Contravariant vertical velocity is computed in | iequations=3 |
| | | | | the predictor step only, velocity tendencies are | |
| | | | | computed in the corrector step only (most efficient | |
| | | | | option) | |
| | | | | 5: Contravariant vertical velocity is computed in | |
| | | | | both substeps (beneficial for numerical stability in | |
| | | | | very-high resolution setups with extremely steep | |
| | | | | slops, otherwise no significant impact) | |
| | | | | 6: As 5, but velocity tendencies are also computed | |
| | | | | in both substeps (no apparent benefit, but more | |
| | | | | expensive) | |
| rayleigh_type | I | 2 | | Type of Rayleigh damping | |
| | | | | 1: CLASSICAL (requires velocity reference state!) | |
| | | | | 2: Klemp (2008) type | |
| rayleigh_coeff | R(n_dom) | 0.05 | | Rayleigh damping coefficient $1/\tau_0$ (Klemp, Dudhia, | |
| | | | | Hassiotis: MWR136, pp.3987-4004); higher values | |
| | | | | are recommended for R2B6 or finer resolution | |
| damp_height | R(n_dom) | 45000 | m | Height at which Rayleigh damping of vertical wind | |
| | | | | starts (needs to be adjusted to model top height; | |
| | | | | the damping layer should have a depth of at least 20 | |
| | | | | km when the model top is above the stratopause) | |
| $htop_moist_proc$ | R | 22500.0 | m | Height above which moist physics and advection of | |
| | | | | cloud and precipitation variables are turned off | |
| ${\it hbot}_{\it qvsubstep}$ | R | 22500.0 | m | Height above which QV is advected with | ihadv_tracer=22, 32, 42 |
| | | | | substepping scheme (must be at least as large as | or 52 |
| | | | | htop_moist_proc) | |
| $vwind_offctr$ | R | 0.15 | | Off-centering in vertical wind solver. Higher values | |
| | | | | may be needed for R2B5 or coarser grids when the | |
| | | | | model top is above 50 km. | |
| ${ m rhotheta_offctr}$ | R | -0.1 | | Off-centering of density and potential temperature | |
| | | | | at interface level (may be set to 0.0 for R2B6 or | |
| | | | | finer grids) | |
| $veladv_offctr$ | R | 0.25 | | Off-centering of velocity advection in corrector step | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------------------|---------------|---------|------|---|-----------------------|
| ivctype | I | 2 | | Type of vertical coordinate: | |
| | | | | 1: Gal-Chen hybrid | |
| | | | | 2: SLEVE (uses sleve_nml) | |
| iadv_rcf | I | 5 | | reduced calling frequency (rcf) for | |
| | | | | transport/diffusion/physics | |
| | | | | 1: no rcf (every dynamics-step) | |
| | | | | n>1: transport every n-th step | |
| | | | | Setting odd values (besides 1) requires l_nest_rcf | |
| | | | | = .TRUE. | |
| lhdiff_rcf | L | .TRUE. | | .TRUE.: Compute diffusion only at advection time | |
| | | | | steps (in this case, divergence damping is applied in | |
| | | | | the dynamical core) | |
| lextra_diffu | L | .TRUE. | | .TRUE.: Apply additional momentum diffusion at | |
| | | | | grid points close to the stability limit for vertical | |
| | | | | advection (becomes effective extremely rarely in | |
| | | | | practice; this is mostly an emergency fix for | |
| | | | | pathological cases with very large orographic | |
| | | | | gravity waves) | |
| ${ m lbackward_integr}$ | $\mid L$ | .FALSE. | | .TRUE.: Integrate backward in time (preparation | |
| | | | | for testing a digital filter initialization) | |
| divdamp_fac | R | 0.004 | | Scaling factor for divergence damping | $lhdiff_rcf = .TRUE.$ |
| $\operatorname{divdamp_order}$ | I | 4 | | Order of divergence damping: | $lhdiff_rcf = .TRUE.$ |
| | | | | 2 = second-order divergence damping | |
| | | | | 4 = fourth-order divergence damping | |
| | | | | 24 = combined second-order and fourth-order | |
| | | | | divergence damping (use for data assimilation cycle | |
| | | | | only!) | |
| $\operatorname{divdamp_type}$ | I | 3 | | Type of divergence damping: | $lhdiff_rcf = .TRUE.$ |
| | | | | 2 = divergence damping acting on 2D divergence | |
| | | | | 3 = divergence damping acting on 3D divergence | |
| l_nest_rcf | $\mid L \mid$ | .TRUE. | | Synchronize interpolation/feedback calls with | |
| | | | | advection (transport) time steps. l_nest_rcf is | |
| | | | | automatically reset to .FALSE. if iadv_rcf=1 | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------|------|---------|------|--|--------------------------|
| l_masscorr_nest | L | .FALSE. | | .TRUE.: Apply mass conservation correction also in | |
| | | | | nested domain | |
| iadv_rhotheta | I | 2 | | Advection method for rho and rhotheta: | |
| | | | | 1: simple second-order upwind-biased scheme | |
| | | | | 2: 2nd order Miura horizontal | |
| | | | | 3: 3rd order Miura horizontal (not recommended) | |
| igradp_method | I | 3 | | Discretization of horizontal pressure gradient: | |
| _ | | | | 1: conventional discretization with metric | |
| | | | | correction term | |
| | | | | 2: Taylor-expansion-based reconstruction of | |
| | | | | pressure (advantageous at very high resolution) | |
| | | | | 3: Similar discretization as option 2, but uses | |
| | | | | hydrostatic approximation for downward | |
| | | | | extrapolation over steep slopes | |
| | | | | 4: Cubic/quadratic polynomial interpolation for | |
| | | | | pressure reconstruction | |
| | | | | 5: Same as 4, but hydrostatic approximation for | |
| | | | | downward extrapolation over steep slopes | |
| l_zdiffu_t | L | .TRUE. | | .TRUE.: Compute Smagorinsky temperature | hdiff_order=3/5 .AND. |
| | | | | diffusion truly horizontally over steep slopes | $lhdiff_temp = .true.$ |
| thslp_zdiffu | R | 0.025 | | Slope threshold above which truly horizontal | hdiff order= $3/5$.AND. |

|------------|------|---------|------|---|-------|
| l_open_ubc | L | .FALSE. | | .TRUE.: Use open upper boundary condition | |
| | | | | (rather than w=0) to allow vertical motions related | |
| | | | | to diabatic heating to extend beyond the model top | |

Defined and used in: src/namelists/mo nonhydrostatic nml.f90

3.23 nwp phy nml

The switches for the physics schemes and the time steps can be set for each model domain individually. If only one value is specified, it is copied to all child domains, implying that the same set of parameterizations and time steps is used in all domains. If the number of values given in the namelist is larger than 1 but less than the number of model domains, then the settings from the highest domain ID are used for the remaining model domains. If the time steps are not an integer multiple of the advective time step (dtime*iadv_rcf), then the time step of the respective physics parameterization is automatically rounded to the next higher integer multiple of the advective time step.

3.25 output_nml

Please note: There may be several instances of output_nml in the namelist file, every one defining a list of variables with separate attributes for output.

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------|------|------------|------|--|-------|
| dom(:) | I | -1 | | Array of domains for which this name-list is used. | |
| | | | | If not specified (or specified as -1 as the first array | |
| | | | | member), this name-list will be used for all | |
| | | | | domains. | |
| | | | | Attention: Depending on the setting of the | |
| | | | | parameter l_output_phys_patch these are either | |
| | | | | logical or physical domain numbers! | |
| file_interval | С | 5 5 | | Defines the length of a file in terms of an ISO-8601 | |
| | | | | duration string (see below). This namelist | |
| | | | | parameter can be set instead of steps_per_file. | |
| filename_format | C | see de- | | Output filename format. Includes keywords path, | |
| | | scription. | | output_filename, physdom, etc. (see below). | |
| | | | | Default is | |
| | | | | <pre><output_filename>_DOM<physdom>_<levtype>_<jf< pre=""></jf<></levtype></physdom></output_filename></pre> | ile> |
| filetype | I | 4 | | One of CDI's FILETYPE_XXX constants. | |
| | | | | Possible values: 2 (=FILETYPE_GRB2), 4 | |
| | | | | (=FILETYPE_NC2), 5 (=FILETYPE_NC4) | |
| h_levels(:) | R | None | m | height levels | |
| | | | | Not yet implemented. | |
| | | | | The height levels are currently always taken from | |
| | | | | array zlevels in namelist nh_pzlev_nml. | |
| hl_varlist(:) | C | None | | Name of height level fields to be output. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---|------|---------|------|---|-------|
| i_levels(:) | R | None | K | isentropic levels | |
| | | | | Not yet implemented. | |
| | | | | The isentropic levels are currently always taken | |
| | | | | from array ilevels in namelist nh_pzlev_nml. | |
| il_varlist(:) | C | None | | Name of isentropic level fields to be output. | |
| include_last | L | .TRUE. | | Flag whether to include the last time step | |
| ml_varlist(:) | C | None | | Name of model level fields to be output. | |
| mode | I | 2 | | 1 = forecast mode, $2 = $ climate mode | |
| | | | | In climate mode the time axis of the output file is | |
| | | | | set to TAXIS_ABSOLUTE. In forecast mode it is | |
| | | | | set to TAXIS_RELATIVE. Till now the forecast | |
| | | | | mode only works if the output is at multiples of 1 | |
| | | | | hour | |
| $\operatorname{north} \operatorname{pole}(2)$ | R | 0,90 | | definition of north pole for rotated lon-lat grids. | |
| $output_bounds(3)$ | R | None | | Post-processing times (in seconds): start, end, | |
| | | | | increment. We choose the advection time step | |
| | | | | matching or following the requested output time. | |
| | | | | See namelist parameters output_start, | |
| | | | | output_end, output_interval for an alternative | |
| | | | | specification of output events. | |
| $output_filename$ | C | None | | Output filename prefix (which may include path). | |
| | | | | Domain number, level type, file number and | |
| | | | | extension will be added, according to the format | |
| | | | | given in namelist parameter "filename_format". | |
| output_grid | L | .FALSE. | | Flag whether grid information is added to output. | |
| output_end | C | 5 5 | | ISO8601 time stamp for end of output. An example | |
| | | | | for this time stamp format is given below. See | |
| | | | | namelist parameter output_bounds for an | |
| | | | | alternative specification of output events. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------------------|------|-----------|------|--|---------|
| output_interval | C | 5 5 | | ISO8601 time stamp for repeating output intervals. | |
| | | | | We choose the advection time step matching or | |
| | | | | following the requested output time. An example | |
| | | | | for this time stamp format is given below. See | |
| | | | | namelist parameter output_bounds for an | |
| | | | | alternative specification of output events. | |
| output start | С | 5 5 | | ISO8601 time stamp for begin of output. An | |
| - <u>-</u> | | | | example for this time stamp format is given below. | |
| | | | | See namelist parameter output_bounds for an | |
| | | | | alternative specification of output events. | ! |
| p levels(:) | R | None | hPa | pressure levels | |
| | | | | Not yet implemented. | |
| | | | | The pressure levels are currently always taken from | |
| | | | | array plevels in namelist nh_pzlev_nml. | |
| pl_varlist(:) | C | None | | Name of pressure level fields to be output. | |
| ready_file | С | 'default' | | A ready file is a technique for handling | |
| | | | | dependencies between the NWP processes. The | |
| | | | | completion of the write process is signalled by | |
| | | | | creating a small file with name ready_file. | |
| | | | | Different output_nml's may be joined together to | |
| | | | | form a single ready file event. The setting of | |
| | | | | ready_file = "default" does not create a ready | |
| | | | | file. The ready file name may contain string tokens | |
| | | | | <pre><path>, <datetime>, <ddhhmmss> which are</ddhhmmss></datetime></path></pre> | |
| | | | | substituted as described for the namelist parameter | |
| | | | | filename_format. | |
| ${ m reg_def_mode}$ | I | 0 | | Specify if the "delta" value prescribes an interval | remap=1 |
| | | | | size or the total *number* of intervals: 0: switch | |
| | | | | automatically between increment and no. of grid | |
| 1 | | | | points, 1: reg_lon/lat_def(2) specifies increment, | |
| | | | | 2: reg_lon/lat_def(2) specifies no. of grid points. | |

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------------|------|------------|------|--|---------|
| reg_lat_def(3) | R | None | | start, increment, end latitude in degrees. Alternatively, the user may set the number of grid points instead of an increment. Details for the setting of regular grids is given below together with an example. | remap=1 |
| reg_lon_def(3) | R | None | | The regular grid points are specified by three values: start, increment, end given in degrees. Alternatively, the user may set the number of grid points instead of an increment. Details for the setting of regular grids is given below together with an example. | remap=1 |
| remap | I | 0 | | interpolate horizontally, 0: none, 1: to regular lat-lon grid | |
| steps_per_file | I | -1 | | Max number of output steps in one output file. If this number is reached, a new output file will be opened. | |
| steps_per_file_inclfirst | L | see descr. | | Defines if first step is counted wrt. steps_per_file files count. The default is .FALSE. for GRIB2 output, and .TRUE. otherwise. | |
| taxis_tunit | Ī | 3 | | 3 = TUNIT_HOUR, 2 = TUNIT_MINUTE Time unit of the TAXIS_RELATIVE time axis. For a complete list of possible values see cdi.inc Till now it only works for taxis_tunit=3 | mode=1 |

Interpolation onto regular grids: Horizontal interpolation onto regular grids is possible through the namelist setting remap=1, where the mesh is defined by the parameters

- reg_lon_def: mesh latitudes in degrees,
- reg_lat_def: mesh longitudes in degrees,
- north_pole: definition of north pole for rotated lon-lat grids.

The regular grid points in reg_lon_def, reg_lat_def are each specified by three values, given in degrees: start, increment, end. The mesh then contains all grid points start + k * increment <= end, where k is an integer. Instead of defining an increment it is also

possible to prescribe the number of grid points.

- Setting the namelist parameter reg_def_mode=0: Switch automatically from increment specification to no. of grid points, when the reg_lon/lat_def(2) value is larger than 5.0.
- 1: reg_lon/lat_def(2) specifies increment
- 2: reg_lon/lat_def(2) specifies no. of grid points

For longitude values the last grid point is omitted if the end point matches the start point, e.g. for 0 and 360 degrees.

Examples

```
local grid with 0.5 degree increment:

reg_lon_def = -30.,0.5,30.

reg_lat_def = 90.,-0.5, -90.

global grid with 720x361 grid points:

reg_lon_def = 0.,720,360.

reg_lat_def = -90.,360,90.
```

Time stamp format: The namelist parameters output_start, output_end, output_interval allow the specification of time stamps according to ISO 8601. The general format for time stamps is YYYY-MM-DDThh:mm:ss where Y: year, M: month, D: day for dates, and hh: hour, mm: minute, ss: second for time strings. The general format for durations is PnYnMnDTnHnMnS. See, for example, http://en.wikipedia.org/wiki/ISO_8601 for details and further specifications.

Examples

```
date and time representation (output_start, output_end) 2013-10-27T13:41:00Z duration (output_interval) POODTO6H00M00S
```

Variable Groups: Using the "group:" keyword for the namelist parameters ml_varlist, hl_varlist, pl_varlist, sets of common variables can be added to the output:

```
group:all output of all variables (caution: do not combine with mixed vertical interpolation)
group:atmo_ml_vars basic atmospheric variables on model levels
group:atmo_pl_vars, group:atmo_zl_vars same set as atmo_ml_vars, but except pres and height, respectively
group:atmo_derived_vars additional prognostic variables of the nonhydrostatic model
group:rad_vars
```

group:precip_vars
group:cloud_diag
group:pbl_vars

group:phys_tendencies

group:land_vars

Keyword substitution in output filename (filename_format):

path substituted by model_base_dir
output_filename substituted by output_filename
physdom substituted by physical patch ID
levtype substituted by level type "ML", "PL", "HL", "IL"
levtype_l like levtype, but in lower case
jfile substituted by output file counter
datetime substituted by ISO 8601 (absolute) date

datetime2 substituted by absolute date: YYYYMMDDThhmmssZ substituted by absolute date: YYYYMMDDThhmmss.sssZ ddhhmmss substituted by relative day-hour-minute-second string

Defined and used in: src/namelists/mo name list output.f90

3.26 parallel nml

| Parameter | Type | Default | Unit | Description | Scope |
|--------------------|------|---------|------|---------------------------------------|---------------------------------------|

| ltestcase | L | .TRUE. | | Idealized testcase runs | |
| ldynamics | L | .TRUE. | | Compute adiabatic dynamic tendencies | |
| iforcing | I | 0 | | Forcing of dynamics and transport by parameterized processes. Use positive indices for the atmosphere and negative indices for the ocean. 0: no forcing 1: Held-Suarez forcing 2: ECHAM forcing 3: NWP forcing 4: local diabatic forcing without physics 5: local diabatic forcing with physics -1: MPIOM forcing (to be done) | |
| ${ m ltransport}$ | L | .FALSE. | | Compute large-scale tracer transport | |
| ntracer | I | 0 | | Number of advected tracers handled by the | |
| | | | | large-scale transport scheme | |
| lvert_nest | L | .FALSE. | | If set to .true. vertical nesting is switched on (i.e. variable number of vertical levels) | |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------------|----------|--------------|------|--|----------------------|
| num_lev | I(max_do | om)31 | | Number of full levels (atm.) for each domain | lvert_nest=.TRUE. |
| nshift | I(max_do | om)0 | | vertical half level of parent domain which coincides | $lvert_nest=.TRUE.$ |
| | | | | with upper boundary of the current domain | |
| ltimer | L | .TRUE. | | TRUE: Timer for monitoring thr runtime of specific | |
| | | | | routines is on $(FALSE = off)$ | |
| timers_level | I | 1 | | | |
| activate_sync_timers | L | F | | TRUE: Timer for monitoring runtime of | |
| | | | | | |
| msg_level | I | 10 | | controls how much printout is written during | |
| | | | | runtime. | |
| | _ | | | For values less than 5, only the time step is written. | |
| msg_timestamp | L | .FALSE. | | If .TRUE., precede output messages by time stamp. | |
| test_mode | I | 0 | | Setting a value larger than 0 activates a dummy | iequations = 3 |
| | | | | mode in which time stepping is changed into just | |
| | | | | doing iterations, and MPI communication is | |
| | | | | replaced by copying some value from the send | |
| | | | | buffer into the receive buffer (does not work with | |
| | | | | nesting and reduced radiation grid because the send | |
| | | | | buffer may then be empty on some PEs) | |
| output | C(:) | "nml","totin | t" | Main switch for enabling/disabling components of | |
| | | | | the model output. One or more choices can be set | |
| | | | | (as an array of string constants). Possible choices | |
| | | | | are: | |
| | | | | • "none": switch off all output; | |
| | | | | • "vlist" : old, vlist-based output mode; | |
| | | | | • "nml": new output mode (cf. output_nml); | |
| | | | | • "totint": computation of total integrals. | |
| | | | | If the output namelist parameter is not set explicitly, the default setting "nml","totint" is assumed. | |

$3.29 \quad sea_ice_nml$

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|---------|------|---|-----------------------------|
| i_ice_therm | I | 2 | | Switch for thermodynamic model: | In an ocean run |
| | | | | 1: Zero-layer model | $i_{sea_ice must be} >= 1.$ |
| | | | | 2: Two layer Winton (2000) model | In an atmospheric run |
| | | | | 3: Zero-layer model with analytical forcing (for | the ice surface type must |
| | | | | diagnostics) | be defined. |
| | | | | 4: Zero-layer model for atmosphere-only runs (for | |
| | | | | diagnostics) | |
| i_ice_dyn | I | 0 | | Switch for sea-ice dynamics: | |
| | | | | 0: No dynamics | |
| | | | | 1: FEM dynamics (from AWI) | |
| i_ice_albedo | I | 1 | | Switch for albedo model. Only one is implemented | |
| | | | | so far. | |
| i_Qio_type | I | 2 | | Switch for ice-ocean heat-flux calculation method: | Defaults to 1 when |
| | | | | 1: Proportional to ocean cell thickness (like | i_ice_dyn=0 and 2 |
| | | | | MPI-OM) | otherwise. |
| | | | | 2: Proportional to speed difference between ice and | |
| | | | | ocean | |
| kice | I | 1 | | Number of ice classes (must be one for now) | |
| hnull | R | 0.5 | m | Hibler's h_0 parameter for new-ice growth. | |
| hmin | R | 0.05 | m | Minimum sea-ice thickness allowed. | |
| $ramp_wind$ | R | 10 | days | Number of days it takes the wind to reach correct | |
| | | | | strength. Only used at the start of an | |
| | | | | OMIP/NCEP simulation (not after restart). | |

$3.30 \quad sleve_nml \; (relevant \; if \; nonhydrostatic_nml:ivctype{=}2)$

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|-----------------------|-------------|-------|

| Parameter | Type | Default | Unit | Description | Scope |
|---------------|------|---------|------|---|-------|
| min_lay_thckn | R | 50 | m | Layer thickness of lowermost layer; specifying zero | |
| | | | | or a negative value leads to constant layer | |
| | | | | thicknesses determined by top_height and nlev | |
| top_height | R | 23500.0 | m | Height of model top | |
| stretch_fac | R | 1.0 | | Stretching factor to vary distribution of model | |
| | | | | levels; values <1 increase the layer thickness near | |
| | | | | the model top | |
| decay_scale_1 | R | 4000 | m | Decay scale of large-scale topography component | |
| decay_scale_2 | R | 2500 | m | Decay scale of small-scale topography component | |
| decay_exp | R | 1.2 | | Exponent of decay function | |
| flat_height | R | 16000 | m | Height above which the coordinate surfaces are flat | |
| lread_smt | L | .FALSE. | | read smoothed topography from file (TRUE) or | |
| | | | | compute internally (FALSE) | |

Defined and used in: src/namelists/mo_sleve_nml.f90

$3.31 \quad time_nml$

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------|------------|------|---|-------|
| $dt_restart$ | R | 86400.*30. | s | Length of restart cycle in seconds. Note that the | |
| | | | | frequency of writing restart files is controlled by | |
| | | | | io_nml:dt_checkpoint. If the value of | |
| | | | | dt_checkpoint resulting from model default or | |
| | | | | user's specification is longer than dt_restart, it will | |
| | | | | be reset (by the model) to dt_restart so that at | |
| | | | | least one restart file is generated during the restart | |
| | | | | cycle. If dt_restart is larger than but not a | |
| | | | | multiple of dt_checkpoint, restart file will NOT be | |
| | | | | generated at the end of the restart cycle. | |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|------------|-------|--|-------|
| calendar | I | 1 | | Calendar type: | |
| | | | | 0=Julian/Gregorian | |
| | | | | 1=proleptic Gregorian | |
| | | | | $2=30 \mathrm{day/month}, 360 \mathrm{day/year}$ | |
| ini_datetime_string | С | '2008-09- | | Initial date and time of the simulation | |
| | | 01T00:00:0 |)(DZ' | | |
| end_datetime_string | С | 2008-09- | | End date and time of the simulation | |
| | | 01T01:40:0 |)(DZ' | | |
| | | | | Length of the run | |
| | | | | If "nsteps" in run_nml (see below) is positive, then | |
| | | | | nsteps*dtime is used to compute the end date and | |
| | | | | time of the run. | |
| | | | | Else the initial date and time, the end date and | |
| | | | | time, dt_restart, as well as the time step are used | |
| | | | | to compute "nsteps". | |

${\bf 3.32 \quad transport_nml \; (used \; if \; run_nml/ltransport=.TRUE.)}$

| Parameter | Type | Default | Unit | Description | Scope |
|--------------|------------|---------|------|---|--|
| lvadv_tracer | L | .TRUE. | | TRUE: compute vertical tracer advection | |
| | | | | FALSE: do not compute vertical tracer advection | |
| ihadv_tracer | I(ntracer) | 2 | | Tracer specific method to compute horizontal | |
| | | | | advection: | |
| | | 5 | | 0: no horiz. transport | |
| | | | | 1: upwind (1st order) | |
| | | | | 2: Miura (2nd order, lin. reconstr.) | |

3.34 vdiff nml

| Parameter | Type | Default | Unit | Description | Scope |
|-------------------|------|---------|------|--|-----------------|
| $lsfc_mon_flux$ | L | .TRUE. | | Switch on surface momentum flux. | lvdiff = .TRUE. |
| lsfc_heat_flux | L | .TRUE. | | Switch on surface sensible and latent heat flux. | lvdiff = .TRUE. |

Defined and used in: $src/namelists/mo_vdiff_nml.f90$

4 Namelist parameters for testcases (NAMELIST_ICON)

The ICON model code includes several experiments, so-called test cases, for the shallow water model as well as the 3-dimensional atmosphere. Depending on the specified experiment, initial conditions and boundary conditions are computed internally.

$4.1 \quad ha_testcase_nml \; (Scope: \; ltestcase=.TRUE. \; and \; iequations=[0,1,2] \; in \; run_nml)$

| Parameter | Type | Default | Unit | Description | Scope |
|------------|------|---------|------|--|--|
| ctest_name | C | 'JWw' | | Name of test case: | |
| | | | | 'SW GW': gravity wave | lshallow water=.TRUE. |
| | | | | 'USBR': unsteady solid body rotation | lshallow_water=.TRUE. |
| | | | | 'Will 2': Williamson test 2 | lshallow water=.TRUE. |
| | | | | 'Will 3': Williamson test 3 | lshallow_water=.TRUE. |
| | | | | 'Will 5': Williamson test 5 | lshallow water=.TRUE. |
| | | | | 'Will 6': Williamson test 6 | lshallow water=.TRUE. |
| | | | | 'GW': gravity wave (nlev=20 only!) | lshallow water=.FALSE. |
| | | | | 'LDF': local diabatic forcing test without physics | lshallow_water=.FALSE. and iforcing=4 |
| | | | | 'LDF-Moist': local diabatic forcing test with | lshallow water=.FALSE., |
| | | | | physics initalised with zonal wind field | and iforcing=5 |
| | | | | 'HS': Held-Suarez test | lshallow water=.FALSE. |
| | | | | 'JWs': Jablonowski-Will. steady state | lshallow water=.FALSE. |
| | | | | 'JWw': Jablonowski-Will. wave test | lshallow water=.FALSE. |
| | | | | 'JWw-Moist': Jablonowski-Will. wave test | lshallow water=.FALSE. |
| | | | | including moisture | _ |
| | | | | 'APE': aqua planet experiment | lshallow_water=.FALSE. |
| | | | | 'MRW': mountain induced Rossby wave | lshallow_water=.FALSE. |
| | | | | 'MRW2': modified mountain induced Rossby wave | $lshallow_water=.FALSE.$ |
| | | | | 'PA': pure advection | $ lshallow_water=.FALSE.$ |
| | | | | 'SV': stationary vortex | lshallow_water=.FALSE., |
| | | | | | $ 	ext{ntracer} = 2$ |
| | | | | 'DF1': deformational flow test 1 | |
| | | | | 'DF2': deformational flow test 2 | |
| | | | | 'DF3': deformational flow test 3 | |
| | | | | 'DF4': deformational flow test 4 | |
| | | | | 'RH': Rossby-Haurwitz wave test | $ lshallow_water=.FALSE.$ |

| Parameter | Type | Default | Unit | Description | Scope |
|---------------------|------|-----------|------------|---|--|
| rotate_axis_deg | R | 0.0 | deg | Earth's rotation axis pitch angle | ctest_name= 'Will_2', 'Will_3', 'JWs', 'JWw', 'PA', 'DF1234' |
| gw_brunt_vais | R | 0.01 | 1/s | Brunt Vaisala frequency | ctest_name= 'GW' |
| gw_u0 | R | 0.0 | m/s | zonal wind parameter | ctest_name= 'GW' |
| gw_lon_deg | R | 180.0 | deg | longitude of initial perturbation | ctest_name= 'GW' |
| gw_lat_deg | R | 0.0 | deg | latitude of initial perturbation | ctest_name= 'GW' |
| jw_uptb | R | 1.0 | m/s (?) | amplitude of the wave pertubation | ctest_name= 'JWw' |
| mountctr_lon_deg | R | 90.0 | deg | longitude of mountain peak | ctest_name= 'MRW(2)' |
| mountctr_lat_deg | R | 30.0 | deg | latitude of mountain peak | ctest_name= 'MRW(2)' |
| mountctr_height | R | 2000.0 | m | mountain height | ctest_name= 'MRW(2)' |
| mountctr_half_width | R | 1500000.0 | m | mountain half width | ctest_name= 'MRW(2)' |
| mount_u0 | R | 20.0 | m/s | wind speed for MRW cases | ctest_name= 'MRW(2)' |
| rh_wavenum | I | 4 | | wave number | ctest_name= 'RH' |
| rh_init_shift_deg | R | 0.0 | deg | pattern shift | ctest_name= 'RH' |
| ihs_init_type | I | 1 | | Choice of initial condition for the Held-Suarez test. 1: the zonal state defined in the JWs test case; other integers: isothermal state (T=300 K, ps=1000 hPa, u=v=0.) | ctest_name= 'HS' |
| lhs_vn_ptb | L | .TRUE. | | Add random noise to the initial wind field in the Held-Suarez test. | ctest_name= 'HS' |
| hs_vn_ptb_scale | R | 1. | m/s | Magnitude of the random noise added to the initial wind field in the Held-Suarez test. | ctest_name= 'HS' |
| lrh_linear_pres | L | .FALSE. | | Initialize the relative humidity using a linear function of pressure. | ctest_name= 'JWw-Moist','APE', 'LDF-Moist' |
| rh_at_1000hpa | R | 0.75 | | relative humidity 0, 1 at 1000 hPa | ctest_name= 'JWw-Moist','APE', 'LDF-Moist' |
| linit_tracer_fv | L | .TRUE. | | Finite volume initialization for tracer fields | ctest_name='PA' |

| Parameter | Type | Default | Unit | Description | Scope |
|----------------|------|---------|------|---|-------------------|
| ape_sst_case | С | 'sst1' | | SST distribution selection | ctest_name='APE' |
| | | | | 'sst1': Control experiment | |
| | | | | 'sst2': Peaked experiment | |
| | | | | 'sst3': Flat experiment | |
| | | | | 'sst4': Control-5N experiment | |
| | | | | 'sst_qobs': Qobs SST distribution exp | |
| | | | | 'sst_ice': Control SST distribution with -1.8 C | |
| | | | | above 64 N/S . | |
| ildf_init_type | I | 0 | | Choice of initial condition for the Local diabatic | ctest_name= 'LDF' |
| | | | | forcing test. 1: the zonal state defined in the JWs | |
| | | | | test case; other: isothermal state (T=300 K, | |
| | | | | ps=1000 hPa, u=v=0.) | |
| ldf_symm | L | .TRUE. | | Shape of local diabatic forcing: | ctest_name= |
| | | | | .TRUE.: local diabatic forcing symmetric about the | 'LDF','LDF-Moist' |
| | | | | equator (at 0 N) | |
| | | | | .FALSE.: local diabatic forcing asym. about the | |
| | | | | equator (at 30 N) | |

Defined and used in: $src/testcases/mo_ha_testcases.f90$

$4.2 \quad nh_testcase_nml \; (Scope: \; ltestcase=.TRUE. \; and \; iequations=3 \; in \; run_nml)$

| Parameter | Type | Default | Unit | Description | Scope |
|------------------|------|---------|------|---|-------|
| nh_test_name | C | 'jabw' | | testcase selection | |
| | | | | 'zero': no orography | |
| | | | | 'bell': bell shaped mountain at 0E,0N | |
| | | | | 'schaer': hilly mountain at 0E,0N | |
| | | | | 'jabw': Initializes the full Jablonowski Williamson | |
| | | | | test case. | |
| | | | | 'jabw s': Initializes the Jablonowski Williamson | |
| | | | | steady state test case. | |

| Parameter | Type | Default | Unit | Description | Scope |
|-----------|------|---------|------|---|----------------------------------|
| | | | | 'jabw_m': Initializes the Jablonowski Williamson | |
| | | | | test case with a mountain instead of the wind | |
| | | | | perturbation (specify mount_height). | |
| | | | | 'mrw nh': Initializes the full Mountain-induced | |
| | | | | Rossby wave test case. | |
| | | | | 'mrw2 nh': Initializes the modified | |
| | | | | mountain-induced Rossby wave test case. | |
| | | | | 'mwbr const': Initializes the mountain wave with | |
| | | | | two layers test case. The lower layer is isothermal | |
| | | | | and the upper layer has constant brunt vaisala | |
| | | | | frequency. The interface has constant pressure. | |
| | | | | 'PA': Initializes the pure advection test case. | |
| | | | | 'HS nh': Initializes the Held-Suarez test case. At | |
| | | | | the moment with an isothermal atmosphere at rest | |
| | | | | (T=300K, ps=1000hPa, u=v=0, topography=0.0). | |
| | | | | 'HS jw': Initializes the Held-Suarez test case with | |
| | | | | Jablonowski Williamson initial conditions and zero | |
| | | | | topography. | |
| | | | | 'APE nh': Initializes the APE experiments. With | |
| | | | | the jabw test case, including moisture. | |
| | | | | 'wk82': Initializes the Weisman Klemp test case | l = limited = area = .TRUE. |
| | | | | 'g lim area': Initializes a series of general | |
| | | | | limited area test cases: itype_atmos_ana | |
| | | | | determines the atmospheric profile, | |
| | | | | itype_anaprof_uv determines the wind profile and | |
| | | | | itype_topo_ana determines the topography | |
| | | | | 'dcmip rest 200': atmosphere at rest test | lcoriolis = .FALSE. |
| | | | | (Schaer-type mountain) | |
| | | | | 'dcmip mw 2x': nonhydrostatic mountain | lcoriolis = .FALSE. |
| | | | | waves triggered by Schaer-type mountain | |
| | | | | 'dcmip gw 31': nonhydrostatic gravity waves | |
| | | | | triggered by a localized perturbation (nonlinear) | |
| | | | | 'dcmip gw 32': nonhydrostatic gravity waves | $l_{\rm limited_area} = .TRUE.$ |
| | | | | triggered by a localized perturbation (linear) | and lcoriolis = .FALSE. |

| Parameter | Type | Default | Unit | Description | Scope |
|------------------------|------|-----------|---------|--|--------------------------------|
| | | | | 'dcmip_tc_51': tropical cyclone test case with | lcoriolis = .TRUE. |
| | | | | 'simple physics' parameterizations (not yet | |
| | | | | ${f implemented})$ | |
| | | | | 'dcmip_tc_52': tropical cyclone test case with | lcoriolis = .TRUE. |
| | | | | with full physics in Aqua-planet mode | |
| | | | | 'CBL': convective boundary layer simulations for | $ $ is_plane_torus= .TRUE. $ $ |
| | | | | LES package on torus (doubly periodic) grid | |
| jw_up | R | 1.0 | m/s | amplitude of the u-perturbation in jabw test case | $nh_test_name='jabw'$ |
| u0_mrw | R | 20.0 | m/s | wind speed for mrw(2) and mwbr_const cases | $nh_test_name =$ |
| | | | | | $'mrw(2)$ _nh' and |
| | | | | | 'mwbr_const' |
| mount_height_mrw | R | 2000.0 | m | maximum mount height in mrw(2) and | $nh_test_name =$ |

Information on vertical level distribution

The hydrostatic and nonhydrostatic models need hybrid vertical level information to generate the terrain following coorindates. The hybrid level specification is stored in <icon home>/hyb params/HYB PARAMS <nlev>. The hydrostatic model assumes to get pressure based coordinates, the nonhydrostatic model expects height based coordinates. For further information see <icon home>/hyb params/README.

Changes incompatible with former versions of the model code

 $\begin{array}{c} var_names_map_file, \ out_varnames_map_file \\ 2013-04-25 \end{array}$

12016

- $\bullet \ {\rm Renamed} \ {\bf var} \quad {\bf names} \quad {\bf map} \quad {\bf file} \rightarrow {\bf output} \quad {\bf nml} \quad {\bf dict}.$
- $\bullet \ {\rm Renamed} \ \mathbf{out} \quad \mathbf{varnames} \quad \mathbf{map} \quad \mathbf{file} \rightarrow \mathbf{netcdf} \quad \mathbf{dict}.$
- The dictionary in netcdf dict is now reversed, s.t. the same map file as in output nml dict can be used to translate variable names to the ICON internal names and back.

output nml: namespace

 $2013 - 0\overline{4} - 26$ 12051

• Removed obsolete namelist variable namespace from output nml.

gribout nml: generatingCenter, generatingSubcenter

2013-04-26 12051

• Introduced new namelist variables generatingCenter and generatingSubcenter.

• If not set explicitly, center and subcenter information is copied from the input grid file

Change:radiation_nml: albedo_typeDate of Change:2013-05-03Revision:12118

- Introduced new namelist variable **albedo type**
- If set to 2, the surface albedo will be based on the MODIS data set.

Change:initicon_nml: dwdinc_filenameDate of Change:2013-05-24Revision:12266

• Renamed dwdinc filename to dwdana filename

- Introduced new namelist flag l ana sfc
- If true, soil/surface analysis fields are read from the analysis fiel dwdfg filename. If false, surface analysis fields are not read. Soil and surface are initialized with the first guess instead

Change:new_nwp_phy_tend_list:output names consistent with variable namesDate of Change:2013-06-25Revision:12590

- \bullet temp tend radlw \rightarrow ddt temp radlw
- \bullet temp tend turb \rightarrow ddt temp turb
- $\bullet \ temp_tend_drag \to ddt_temp_drag$

Change: prepicon_nml, remap_nml, input_field_nml

 Change:
 prepicon_in.

 Date of Change:
 2013-06-25

 Revision:
 12597

- Removed the sources for the "prepicon" binary!
- The "prepicon" functionality (and most of its code) has become part of the ICON tools.

Change:initicon_nmlDate of Change:2013-08-19Revision:13311

• The number of vertical input levels is now read from file. The namelist parameter **nlev_in** has become obsolete in r12700 and has been removed.

 $\begin{array}{ll} {\it Change:} & {\it parallel_nml} \\ {\it Date\ of\ Change:} & {\it 2013-10-14} \\ {\it Revision:} & {\it 14160} \end{array}$

• The namelist parameter exch msgsize has been removed together with the option iorder sendrecv=4.

 Change:
 parallel_nml

 Date of Change:
 2013-08-14

 Revision:
 14164

• The namelist parameter use sp output has been replaced by an equivalent switch use dp mpi2io (with an inverse meaning, i.e. we have use $dp mpi\overline{2io} = .NOT$. use sp output).

 $\begin{array}{ll} {\it Change:} & {\it parallel_nml} \\ {\it Date~of~Change:} & {\it 2013-08-15} \\ {\it Revision:} & {\it 14175} \end{array}$

• The above-mentioned namelist parameter use dp mpi2io got the default .FALSE. By this, the output data are sent now in single precision to the output processes.

Change: initicon_nml: l_ana_sfc
Date of Change: 2013-10-21
Revision: 14220

• The above-mentioned namelist parameter l ana sfc has been replaced by lread ana. The default is set to .TRUE., meaning that analysis fields are required and read on default. With Iread ana=.FALSE. ICON is able to start from first guess fields only.

Change: output_nml: lwrite_ready, ready_directory

Date of Change: 2013-10-25
Revision: 14301

- The namelist parameters lwrite ready and ready directory have been replaced by a single namelist parameter ready file, where ready_file /= 'default', enables writing ready files.
- Different output_nml's may be joined together to form a single ready file event they share the same ready_file.

Change:output_nml: output_boundsDate of Change:2013-10-25Revision:14391

• The namelist parameter **output bounds** specifies a start, end, and increment of output invervals. It does no longer allow multiple triples.

Change:output_nml:steps_per_fileDate of Change:2013-10-30Revision:14422

• The default value of the namelist parameter steps per file has been changed to -1.

 $\begin{array}{ccc} {\it Change:} & {\it run_nml} \\ {\it Date~of~Change:} & {\it 2013-11-13} \\ {\it Revision:} & {\it 14759} \end{array}$

- The dump/restore functionality for domain decompositions and interpolation coefficients has been removed from the model code. This means, that the parameters
 - ldump_states,
 - lrestore_states,
 - ldump_dd,
 - lread_dd,
 - nproc_dd,
 - dd_filename,
 - dump_filename,
 - l_one_file_per_patch

have been removed together with the corresponding functionality from the ICON model code.

Change:output_nml:filename_formatDate of Change:2013-12-02Revision:15068

• The string token <ddhhmmss> is now substuted by the relative day-hour-minute-second string, whereas the absolute date-time stamp can be inserted using <datetime>.

Change: output_nml: ready_file
Date of Change: 2013-12-03

Revision:15081

• The ready file name has been changed and may now contain string tokens <path>, <datetime>, <ddhhmmss> which are substituted as described for the namelist parameter filename_format.
